Bureau of Indian Affairs
Fire Occurrence Reporting System – User's Guide
2007

TABLE OF CONTENTS

This page was intentionally left blank.

WHAT'S NEW

This section of the User's Guide highlights the most recent changes to the DI-1202-BIA Individual Fire Report form, the WFMI fire reporting module, and/or BIA fire reporting policy, guidelines, and process.

The footer of this document and the Individual Fire Report form and templates shows the version date to help users ensure they have the latest release. This May 2007 combined update of the Individual Fire Report form and User's Guide replaces the following previous versions:

- May 2005 version of the DI-1202-BIA Individual Fire Report form and templates, which was released in conjunction with the switch from SACS to WFMI.
- May 2006 version of the User's Guide, which was an interim update to the May 2005 inaugural release. The May 2006 version was made available on the WFMI website, but not distributed in hardcopy because the changes (included in the items listed below) were relatively minor.

Incident/Fire Name Field

The maximum allowable length of the Incident/Fire Name has been expanded from 10 characters to 20. This change was documented in the May 2006 interim update of User's Guide.

In May 2007, the DI-1202-BIA Individual Fire Report was modified slightly, with the Incident/Fire Name field being moved from the block previously labeled "Agency Data" to the block labeled "General Reporting Information" at the top of the report. This is a more appropriate location for the Incident/Fire Name, as the block contains other identifying information, such as the Fire Number and FireCode.

Location Data Fields

Perhaps the most significant change in this May 2007 update involves the fields in the block now labeled "Location Data". Previously, this block was labeled "Agency Data", and it included both the Incident/Fire Name field and the location coordinate fields. With the Incident/Fire Name field being moved, as noted above, all that remains are the fields pertaining to the location of the point of origin, hence the renaming of this block.

Two new fields have been added to provide a qualitative assessment of the location data. The field labeled "Origin – Accuracy" will be used to document the level of certainty that the location described is the actual point of origin. The field labeled "Location – Method" will be used to document the method by which the location coordinates were determined (from a map, using GPS, etc).

The format options for location coordinates have been expanded to include Decimal Degrees and Degrees/Decimal Minutes. As before, Degrees/Minutes/Seconds and UTM are valid formats too. Regardless of the format chosen, WFMI will now accept coordinates with decimal values sufficient to describe the point of origin to sub-foot (for latitude/longitude) or sub-meter (for UTM) precision.

A new section, labeled "Certainty and Precision" has been added to this User Guide to further describe the relationship between the new fields. It also specifies the number of decimal digits (places) that WFMI will accept for the various coordinate formats, including the recommended minimum level of precision.

Signature Block Fields

Formerly, the Signature block contained two fields – Entered By and Authorized By. The Entered By field had caused some confusion, as some users (correctly) indicated the name of the person who filled-out the original, paper fire report form, while others (incorrectly) indicated the name of the person who encoded that fire report into the computer system (SACS or WFMI).

To alleviate this confusion, the field formerly known as Entered By has been renamed to Data Provided By. As before, this field should capture the name of the person who provides the data for the fire report. This is usually the IC or unit FMO, and the data is often provided in the form of a hand-written fire report; although size-up checklists and other customized forms are increasingly replacing the handwritten fire report (then the fire report is printed from WFMI, signed, and retained as the "original" hardcopy in the local files).

A new field – Report Entered By – has been added to capture the name of the person who encodes the fire report data into WFMI. When a report is initiated in WFMI, this field is automatically filled-in based on the user's log-in profile information. If needed, perhaps because someone initiates the report in WFMI and someone else finishes it, the information in the Report Entered By field can be changed by the user.

The Authorized By field remains unchanged, and is still intended to capture the name of the person who certifies that the fire report has been completed correctly and that the data is valid.

These changes were documented in the May 2006 interim update of User's Guide; however, the DI-1202-BIA Individual Fire Report form was not updated at that time because WFMI automatically populates the new field. For this May 2007 release, however, the DI-1202-BIA Individual Fire Report form has been modified so that the Signature block on the Individual Fire Report form now matches the data entry screen in WFMI.

Support Actions

The 2007 version of BIA's "Blue Book" includes two changes with regard to fire reports for Support Actions. First, guidance which formerly was conflicting has been resolved, as the "Blue Book" now clearly states that units should issue a report for every fire-related Support Action, including those incidents where they provided support to another unit. Because some units have issued Support Action reports to document their fire program's support for non-fire incidents, the "Blue Book" provides another point of clarification – for all-hazard incidents, only those that are associated with a Presidentially-declared disaster (e.g. major hurricane, flood, earthquake, etc.) should be documented on a fire report and entered into WFMI. While the fire programs may provide support for other all-risk incidents, those lesser incidents should not be documented in the fire reporting system.

Time Limits for WFMI User Accounts

In accordance with BLM's IT security protocols, WFMI users must change their passwords every 90 days or sooner. Otherwise, the account is locked at the end of the 90-day period (there is no longer a grace log-in allowed after a password expires). Users must contact the Help Desk (see Appendix A) to have their account unlocked and their password reset.

Activity for BIA and Tribal user accounts in WFMI is reviewed quarterly, and user accounts that have not been used in 400 days or more will be removed from the system. The Regional Offices are notified prior to the purging and, presumably, will indicate which user accounts, if any, should not be deleted.

GENERAL INFORMATION FOR FIRE OCCURRENCE REPORTING

Note: in addition to the information below, formal guidelines relating to fire occurrence can be found in BIA's Wildland Fire and Aviation Program Management and Operations Guide, which is commonly known as the "Blue Book" (see Appendix D).

What is the BIA Fire Occurrence Reporting System?

The Bureau of Indian Affairs (BIA) Fire Occurrence Reporting System (FORS) is the collection of fire reporting policies, guidelines and instructions; standardized report elements and data definitions; report forms and templates; archived hard-copy documents; corporate computer database; and statistical summaries and other outputs derived from such data. While the computer database, the Wildland Fire Management Information (WFMI) System is an integral component, it is not synonymous with FORS – FORS is the name used to describe all of the elements comprising BIA's fire occurrence reporting business.

What are Individual Fire Reports?

Fire reports are official records of fires or other incidents managed by the wildland fire management program. They include descriptive and statistical information such as cause, location, action taken, final size, etc.

While fire reports vary in form and detail from agency to agency, the BIA uses the DI-1202-BIA Individual Fire Report form (see Appendix B for a master template of the fire report). While the DI-1202-BIA form is considered (and titled) the fire report, the fire report packet for larger or more complex incidents may include several components:

- Completed DI-1202-BIA Individual Fire Report form
- Written narrative description of incident
- Map of fire perimeter (recommended for fires 10 acres or larger in size and required for fires 100 acres or larger)
- Other documentation deemed necessary by the unit and/or Regional office, such as photographs, GPS data file, law enforcement records, etc.

Hard copy versions of the above-listed documents are filed and archived by the local unit. In addition, information from the Individual Fire Report form and narrative description must also be entered into the fire reporting module in WFMI, which serves as the interagency computer database for the BIA, Bureau of Land Management (BLM), and National Park Service (NPS).

Fire reports are legal documents, and they may be examined to determine the timeliness and scope of the unit's responses. When archived in WFMI, the information from the reports is used to quantify and otherwise characterize the unit's workload for formal planning and reporting efforts. This data provides the

basis for budget and resource planning and allocation decisions. It is also used to for other critical purposes, such as measuring compliance with performance elements, developing statistical summaries, etc.

What types of incidents should be documented with an Individual Fire Report?

Given the uses described above, an Individual Fire Report should be created for every fire-related incident where action was taken beyond baseline preparedness activities.

For example, a scheduled mid-day engine patrol obviously would not require a fire report; however, an after-hours engine patrol that was initiated in response to a smoke report, even if it ultimately proved to be a false alarm, should be documented with a fire report. In the latter case, the patrol would not have normally occurred, and it probably resulted in expenditure of emergency funds (e.g. overtime for the engine crew).

The following types of incidents fall within the scope of BIA FORS and should be documented on an Individual Fire Report:

- Type 1*: suppressed wildland fires
- Type 2*: natural outs
- Type 3*: support actions (including support for Presidentially-declared all-hazard disasters)
- Type 4*: prescribed fires (including wildland fire use incidents)
- Type 5*: false alarms

Who is responsible for completing an Individual Fire Report?

Generally, the Incident Commander (IC) is responsible for preparing the Individual Fire Report. The local unit Line Officer or his/her designee, usually the Fire Management Officer (FMO) is responsible for approving the report.

Once the report has been prepared, it must be entered into WFMI. Access privileges (e.g. user profile and login ID) to WFMI are granted to specific individuals who are tasked with entering fire reports for specific units. Entering fire reports in WFMI is typically done by the fire clerk, dispatcher, and/or FMO at the local unit or Zone.

When is the Individual Fire Report "due"?

The Individual Fire Report must be initiated soon after the incident has concluded; however, most of the data elements can be documented while the incident is in-progress, so units are encouraged to initiate the report upon initial action.

Deadlines for entering fire reports in WFMI are as follows:

- Suppressed wildland fires: within 14 days after the fire is declared "out".
- Natural outs and false alarms: within 14 days after discovery or notification.
- Support actions: within 14 days after all resources belonging the unit making the support action report have been released from the incident or other support activities have ceased.
- Prescribed fires: within 14 days after project field operations have concluded

In some cases, these deadlines will require the user to initially enter estimates rather than actual data figures. For example, the actual burned acreage may not be known until GPS data can be collected and processed in GIS. Such instances should not delay the preparation of the Individual Fire Report beyond the deadlines noted above; however, once the actual/final data is available, the hardcopy fire report and data in WFMI must be updated accordingly.

What are the records management requirements for Individual Fire Reports?

The completed Individual Fire Report form may be a "manual" version, where a blank DI-1202-BIA form (or template) has been filled in by hand in ink. The information subsequently must be documented in an "electronic" version of the fire report in WFMI. It is imperative that the information entered for the "electronic" version in WFMI exactly matches the "manual" version.

If a "manual" version of the fire report was not prepared (that is, if the data was collected on size-up checklists and other custom-forms, so the actual fire report was first documented directly in WFMI), then a hard copy of the "electronic" version must be printed from WFMI.

In either case, the hard copy fire report must be signed to indicate its approval by the Line Officer or his/her designee.

Whenever information (such as final acreage figures) is updated, it must be noted on both the approved hard copy of the Individual Fire Report and the "electronic" version in WFMI.

The local unit or Zone should prepare a separate file of all hard copy documents associated with an Individual Fire Report (see list of fire report components in the section above entitled "What are Individual Fire Reports?"). The file also should include pertinent digital data (i.e. computer files, preferably saved on optical media such as CD or DVD), such as GPS points/tracks and digital photographs. Files should be named with reference to calendar year and fire/incident/project number.

These files must be permanently retained, as dictated by the BIA's record management policies and guidelines. Typically, the local unit or Zone should keep all files for the previous 10 years on-site and readily accessible. Older files must be retained, but may be moved off-site for long-term archival. Consult your local Records Manager for additional information.

Who is responsible for ensuring compliance with these reporting requirements?

Fire occurrence reports are very important, and everyone involved must be committed to creating complete and accurate records. If you are uncertain about the requirements or need other assistance, your first contact should be to your Regional FMO. If the Regional FMO is unable to fulfill your needs, you should then contact the BIA's national fire occurrence Subject Matter Expert (SME) (see Appendix A).

By signing the Individual Fire Report to indicate approval, the Line Officer or his/her designee attests that the fire reporting requirements have been fulfilled.

The Regional FMO should monitor fire reporting activities for all units under the Region's jurisdiction to ensure all required data is being collected and archived appropriately. In addition, data in WFMI will be reviewed periodically by the Regional FMO and national SME for quality assurance. Any irregularities noted may trigger an audit of a unit's reporting practices and files.

Periodic audits may also be done in the absence of known problems. Such audits are not conducted for the purpose of finding reporting violations. Rather, these audits provide an opportunity to thoroughly review a unit's reporting practices and files to showcase strong points, identify weaknesses, and develop specific recommendations to maximize the efficiency of the reporting effort and to improve the quality of the data.

Who do I contact if I need help?

Please read through this document first, as it provides the answers to almost all basic questions about the BIA's fire occurrence reporting system. If additional help is needed, you must first determine the nature of your request. General questions regarding fire occurrence should be directed to BIA's national fire occurrence SME. Technical questions regarding the WFMI system should be directed to the NIFC Help Desk.

User support contact information for the BIA's national fire occurrence SME and the NIFC Help Desk can be found in Appendix A.

HISTORY OF FIRE REPORTING IN BIA

Unfortunately, the earliest history of fire reporting in BIA is not well documented. While a few older hardcopy "reports" exist for notable large fires from the first few decades of 20th century, the fire history for BIA essentially begins with records from 1972, when formal fire reporting requirements for BIA and other Interior Bureaus apparently were instituted. Around 1982, Interior developed a standardized fire report form, the DI-1202 Individual Fire Report. A couple of years later, a centralized computer at the Boise Interagency Fire Center (BIFC) offered the Wildland Fire Information System, a system that allowed users to input and archive DI-1202 records electronically. In the early 1990's, BIFC became the National Interagency Fire Center, and the computer system had evolved to become the Interior's interagency Shared Applications Computer System (SACS), which included modules for fire reporting, planning and budget, and personnel qualifications.

In May 2005, the BIA's Fire Occurrence Reporting System, as the collective components are now known, was substantially overhauled. Most significantly, the computerized fire reporting module was switched from SACS to WFMI, which the BLM developed and began using in 1998. Now, WFMI is an interagency platform, serving BIA and National Park Service, in addition to Bureau of Land Management. Like SACS, WFMI offers more than just the fire reporting module – it also hosts modules pertaining to lightning detection, weather, and unit identifiers.

In comparison with SACS, the fire reporting module in WFMI provides significant enhancements to make it easier to enter a fire report and improve the quality of the data collected. Key features include accessibility via Internet with a common browser, agency and unit-specific pick lists for most fields, agency-specific and context-sensitive help screens, and robust data validation.

All historical fire occurrence records from SACS were successfully transferred to WFMI. While the SACS records passed the most critical data validation tests to allow them to be imported into WFMI, many records failed lesser validation tests, which resulted in them being flagged as "incomplete". In ongoing cleanup efforts, users have edited many of these historic records in WFMI to resolve the validation errors, thereby changing their status to "complete".

In developing the interagency fire reporting module in WFMI, the BIA, BLM, and NPS modified their fire occurrence reporting elements in an attempt to standardize as much as possible; however, a few agency-specific needs persisted, so each Bureau has a slightly different variant of the fire report form. The BIA's substantially-revised Individual Fire Report (DI-1202-BIA) form was placed in service in May 2005, along with an improved set of instructions, the Fire Occurrence Reporting System User's Guide (this document).

The May 2005 release of the DI-1202-BIA Individual Fire Report form and FORS User Guide were updated again in May 2007, with the relatively minor changes noted in the preceding section (see "What's New").

See Appendix B for a master template of the fire report.

INCIDENT TYPE DEFINITIONS AND REQUIREMENTS

Overview

Incidents are classified according to their Incident Type, which is the pairing of the codes for Fire Type and Protection Type. Reporting requirements (e.g. mandatory data fields and specific reporting instructions) vary depending on this classification. See Appendix C for a listing of mandatory fields by Incident Type.

The BIA's definitions for Fire Types and Protection Types are presented below. For each Incident Type, there is a corresponding template – a blank DI-1202-BIA Individual Fire Report form that is specific for the given Incident Type. In these templates, mandatory fields appear normal, while non-mandatory fields are shaded gray. These templates are intended primarily for use as job aids; however, a hard copy of a template can be filled in by hand to prepare a manual version of an Individual Fire Report for the corresponding Incident Type.

While these templates are also accessible on-line from the WFMI instructions and help menus, they are NOT data entry screens for WFMI.

The WFMI allows users to enter data in non-mandatory fields at their discretion. However, if a fire report is lacking data for one or more mandatory fields, WFMI will flag the report as "incomplete". Incomplete reports will not be included in official statistical summaries, nor in datasets for formal planning efforts. Because of this, units must make every effort to collect data for mandatory fields and resolve any outstanding incomplete fire reports in WMFI.

Fire Type 1 – Wildland Fires Suppressed

All wildland fires suppressed by BIA employees regardless of land ownership; or by contractors or cooperators on BIA-protected land. Also includes unwanted fires on BIA-protected lands for which an appropriate management response, such as a confinement or containment strategy, was selected in lieu of full suppression.

> Special Case: Fire Type 1 also applies to the escaped portions of prescribed burns and wildland fire use incidents that exceed their prescriptions and are then suppressed or managed with an appropriate management response such as a confinement or containment strategy. In these cases, the escaped portion should be documented in a separate, Type 1, fire report, using the General Remarks field to fully describe the event and identify the corresponding pre-escape (i.e. Type 4) incident by its Calendar Year and Fire Number.

Protection Types associated with Fire Type 1

Protection Type 1 (see Incident Type 11 template) – Trust land protected by BIA. The BIA has the fire suppression responsibility.

Protection Type 2 (see Incident Type 12 template) – Trust lands protected by another Federal agency via formal agreement (including mutual aid agreements). Another agency does the suppression work.

Protection Type 3 (see Incident Type 13 template) – Trust lands protected by a non-Federal agency (e.g. tribe, state, county, or city) under a cooperative agreement, memorandum of understanding, contract, or compact.

Protection Type 4 (see Incident Type 14 template) – Trust lands where action is limited to monitoring or reduced suppression response because of low fire danger or low resource impact.

Protection Type 5 (see Incident Type 15 template) – Other (non-Trust) lands not under agreement, memorandum of understanding, or contract, but where BIA or Tribal Compact suppression action was taken to prevent fire spread to Trust lands.

Protection Type 6 (see Incident Type 16 template) – Other (non-Trust) lands protected by BIA or Tribal Compact under a memorandum of understanding, interagency mutual aid agreement, or contract.

Fire Type 2 – Natural Outs

All wildland fires discovered after they have been extinguished by natural causes regardless of cause or location within agency lands. Also used for fires extinguished prior to dispatch of suppression forces. No suppression action took place by the dispatched resources.

Protection Types associated with Fire Type 2

Protection Type 1 (see Incident Type 21 template) – Trust land protected by BIA. The BIA has the fire suppression responsibility.

Protection Type 2 (see Incident Type 22 template) – Trust lands protected by another Federal agency via formal agreement (including mutual aid agreements). Another agency does the suppression work.

Protection Type 3 (see Incident Type 23 template) – Trust lands protected by a non-Federal agency (e.g. tribe, state, county, or city) under a cooperative agreement, memorandum of understanding, contract, or compact.

Protection Type 5 (see Incident Type 25 template) – Other (non-Trust) lands not under agreement, memorandum of understanding, or contract, but where BIA or Tribal Compact suppression action was taken to prevent fire spread to Trust lands.

Protection Type 6 (see Incident Type 26 template) – Other (non-Trust) lands protected by BIA or Tribal Compact under a memorandum of understanding, interagency mutual aid agreement, or contract.

Fire Type 3 – Support Actions

Assistance provided at the request of a cooperator for the suppression of active or anticipated fires, or assistance provided to prescribed fire operations in a cooperator's jurisdiction. Also used for tracking support for non-local cooperators, such as using unit personnel and resources to fill resource orders or otherwise provide support to off-unit incidents.

> Special Case: Fire Type 3 is also used to document support provided to non-fire incidents; however, reporting is limited to only Presidentially-declared all-hazard disasters (e.g. major hurricanes, floods, earthquakes, etc). While fire program resources may be used to support lesser non-fire incidents, these do not warrant a Support Action in the fire reporting system.

Please note that Fire Type 3 does NOT include fire suppression responses provided under established local mutual aid agreements (these would be reported using Fire Type 1/Protection Type 6).

Protection Types associated with Fire Type 3

Protection Type 7 (see Incident Type 37 template) – Support actions by BIA or Tribal Compact resources.

Fire Type 4 – Prescribed Fires

All BIA fires implemented or managed in accordance with approved Fire Management and Prescribed Fire Plans. This includes management-ignited prescribed burns and wildland fire use incidents.

> Special Case: Wildfire ignitions that occur within prescribed burn units, with fire behavior that is in prescription, may be treated as prescribed burns.

> Special Case: Prescribed burns and wildland fire use incidents that exceed their prescriptions and are suppressed require two fire reports. Prepare one report, using Fire Type 4, to represent only the portion of the fire that burned within prescription, using the "Escape" field to indicate that suppression action was taken and to identify the corresponding post-escape (i.e. Type 1) incident by its Calendar Year and Fire Number. Prepare another report, using Fire Type 1, to represent the escaped portion of the incident.

Protection Types associated with Fire Type 4

Protection Type 8 (see Incident Type 48 template) – Management-ignited prescribed burns.

Protection Type 9 (see Incident Type 49 template) – Wildland fires ignited by lightning, volcanic activity, or other natural ignition sources and managed as wildland fire use incidents.

Fire Type 5 – False Alarms

All reported fires for which a response was initiated (e.g. detection patrol, initial attack resources dispatched, etc.), but no suppression action took place because the fire did not occur, or it was not found in spite of efforts to locate it (presumed false alarm).

> Special Case: If no response action was taken, do not prepare a report.

Protection Types associated with Fire Type 5

Protection Type 1 (see Incident Type 51 template) – Trust land protected by BIA. The BIA has the fire suppression responsibility.

Protection Type 2 (see Incident Type 52 template) – Trust lands protected by another Federal agency via formal agreement (including mutual aid agreements). Another agency does the suppression work.

Protection Type 3 (see Incident Type 53 template) – Trust lands protected by a non-Federal agency (e.g. tribe, state, county, or city) under a cooperative agreement, memorandum of understanding, contract, or compact.

Protection Type 5 (see Incident Type 55 template) – Other (non-Trust) lands not under agreement, memorandum of understanding, or contract, but where BIA or Tribal Compact resources took action to potentially prevent fire spread to Trust lands.

Protection Type 6 (see Incident Type 56 template) – Other (non-Trust) lands protected by BIA or Tribal Compact under a memorandum of understanding, interagency mutual aid agreement, or contract.

INSTRUCTIONS FOR THE DI-1202-BIA INDIVIDUAL FIRE REPORT

GENERAL REPORTING INFORMATION FIELDS

This section of the Individual Fire Report contains fields for general information that applies to virtually every type of incident. In WFMI, this section appears on the main Fire Report form.

Status of Fire Report: This field only appears on copies of the Individual Fire Report printed from WFMI and is not user-editable. In WFMI, this field is populated automatically, with status assigned as follows:

> Complete – Indicates that all mandatory fields have been completed for this Fire Type/Protection Type. In addition, all data are in compliance with validation criteria.
>
> Incomplete – Indicates that one or more mandatory fields is lacking data and/or some data has failed validation tests. Records will remain flagged as incomplete until they are manually edited in WFMI to correct these deficiencies.

Bureau: Bureau/Agency associated with the Reporting Unit. This will be "Bureau of Indian Affairs" for all BIA and Tribal units. In WFMI, this field is populated automatically, based on the Reporting Unit.

Region: Descriptive name of the BIA Region associated with the Reporting Unit. Example – Eastern Oklahoma Region.

Region is a mandatory field for all Incident Types. In WFMI, this field is populated automatically, based on the Reporting Unit.

Reporting Unit: Descriptive name of the Reporting Unit. Example – Wind River Agency. The list of recognized BIA and Tribal Reporting Units can be found in Appendix F.

Reporting Unit is a mandatory field for all incidents. In WFMI, the user selects from a pick list, with the choice(s) dependent upon the units associated with the user's profile.

Unit Identifier: The official (usually 5-character) unit identifier associated with the Reporting Unit (see Appendix F). Example – AZHOA (for Hopi Agency).

Unit Identifier is a mandatory field for all Incident Types. In WFMI, this field is populated automatically, based on the Reporting Unit.

Please note that BIA's alpha-numeric organization codes (e.g. H65 for Hopi Agency) are no longer used for fire reporting purposes.

Calendar Year: The 4-digit calendar year associated with the incident Discovery/Start Date.

Calendar Year is a mandatory field for all Incident Types. In WFMI, this field is populated automatically, based on the Discovery/Start Date.

Fire Number: The unique 4-digit number for the incident documented in the Individual Fire Report.

Fire Number is a mandatory field for all Incident Types.

For each Reporting Unit, incidents should be numbered chronologically based on calendar year (i.e. the first incident that begins on or after January 1 of each year should be given Fire Number 0001). Every Individual Fire Report within a given calendar year must be given its own unique Fire Number (that is, the same Fire Number cannot be assigned to multiple fire reports).

Please note that the Fire Code cannot be used as a Fire Number because the same Fire Code can be associated with more than one fire report. Furthermore, the Fire Code has alphabetic characters, and the Fire Number must consist only of digits.

Fire Code: The 4-character alpha-numeric fiscal code associated the incident. See the Fire Code guidance in Appendix E for more information. Note: the Fire Code system went into operation as of October 1, 2003.

Fire Code is a mandatory field for the following Incident Types: 11-16, 37, 51-56.

Incident Type: The 2-digit code, comprised of the codes for Fire Type and Protection Type (see below).

Fire Type: The 1-digit code that describes the type of incident (see table below). See the section of this document entitled "Incident Type Definitions and Requirements" for more information. When combined, the Fire Type and Protection Type codes create the Incident Type code.

Fire Type is a mandatory field for all Incident Types.

Fire Type Description	*Fire Type Code*
Wildland Fires Suppressed	1
Natural Outs	2
Support Actions	3
Prescribed Fires	4
False Alarms	5

Protection Type: The 1-digit code that describes the protection responsibility for the incident (see table below). See the section of this document entitled "Incident Type Definitions and Requirements" for more information. When combined, the Fire Type and Protection Type codes create the Incident Type code.

Protection Type is a mandatory field for all Incident Types.

Protection Type Description	*Protection Code*	*Applies to Fire Types*
Trust land protected by BIA. BIA has the fire suppression responsibility.	1	1,2,5
Trust lands protected by another Federal agency via formal agreement (including mutual aid agreements). Another agency does the suppression work.	2	1,2,5
Trust lands protected by a non-Federal agency (e.g. tribe, state, county, or city) under a cooperative agreement, memorandum of understanding, contract, or compact.	3	1,2,5
Trust lands where action is limited to monitoring or reduced suppression response because of low fire danger or low resource impact.	4	1
Other (non-Trust) lands not under agreement, memorandum of understanding, or contract, but where BIA or Tribal Compact resources took action to potentially prevent fire spread to Trust lands.	5	1,2,5
Other (non-Trust) lands protected by BIA or Tribal Compact under memorandum of understanding, interagency mutual aid agreement, or contract.	6	1,2,5
Support actions by BIA or Tribal Compact resources.	7	3
Management-ignited prescribed burns.	8	4
Wildland fires ignited by lightning, volcanic activity, or other natural ignition sources and managed as wildland fire use incidents.	9	4

Incident Name: Name of the incident. The name should be descriptive, yet brief, and in good taste. Typically, fires should be named with reference to their geographic location or nearby landscape features. A unit should avoid using the same name for more than one incident within any given calendar year.

In WFMI, the Incident Name is specified by the user. The name is limited to 20 alpha-numeric characters, and it can include any characters found on a standard keyboard, except two special characters – the comma and the vertical line (aka "pipe") symbol – that are reserved for use as field delimiters in output files.

The Incident Name specified on the Individual Fire Report should exactly match the name used on related documents, such as the record in the FireCode system and ICS-209 Incident Status Summary reports.

Incident Name is a mandatory field for all Incident Types.

Cause Category: A short descriptor of the cause of ignition – human or natural – for the incident (see table below). Natural causes are paired with a descriptor of the ignition source. For human-caused ignitions, the source/method will be identified in the General/Specific Cause fields on the Fire Trespass section of the fire report.

Cause Category is a mandatory field for the following Incident Types: 11-16, 48-49.

Please note that if "Natural – Other, Known" is selected, you must include an expanded description in the remarks section of the fire report.

Primary Source of Ignition
Natural – Lightning
Natural – Volcanic
Natural – Other, Known
Natural – Other, Unknown
Human

Burning Index: The 3-digit value (ranging from 0 to 300) for the NFDRS Burning Index on the incident Discovery/Start date. The Burning Index (BI) should be derived from the weather station (or Special Interest Group of stations) used to determine the unit's initial attack resources and staffing level on the day of the fire.

Please note that the BI reported here does not necessarily correlate to the actual BI for the fire site or for the weather station listed on the fire report.

STATISTICAL DATA FIELDS

This section of the Individual Fire Report captures details about the ownership, major vegetative cover, and burned acreage for all units affected by a wildland fire or prescribed fire incident. At least one set of data is required, and it must be entered in the first row of the form in WFMI. If needed, up to 7 additional sets of data can be specified – these should be entered in the succeeding rows.

In WFMI, this section appears on the main Fire Report form.

State: The 2-letter standard US Postal abbreviation for the state(s) where the incident occurred. Example – AZ (for Arizona). In WFMI, the user selects from a pick list. Because these postal abbreviations are commonly known, the list is not shown here. Please note that the States are no longer identified by their FIPS codes for fire reporting purposes.

> Special Case: When one of the Owners is "Foreign" (see below), the corresponding State field should be left blank.

State is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Owner: The 1-digit code describing the owner for a particular set (row) of statistical data (see table below).

Literally speaking, BIA does not "own" most of the land under its protection; rather, these are lands whose titles are held in trust by the US Government on behalf of Tribal and/or individual Indian owners. Such Indian trust lands protected by BIA or a contractor (including a contract Tribal fire program) working on behalf of BIA should be described using Owner code 2 (BIA). Non-trust tribal lands or Indian trust lands protected by a compact fire program should be described using Owner code 9 (Tribal). Non-trust lands owned by individual Indians should be described using Owner code 8 (Private).

Certain Reporting Units, such as Papago Agency in Arizona and Blackfeet Agency in Montana, that are adjacent to the international border between the USA and Mexico or Canada may report fires whose perimeters cross the border. In such cases, the burned area in Mexico or Canada should be documented using Owner code 0 (Foreign).

Owner is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Owner Description	*Owner Code*
BLM	1
BIA	2
NPS	3
FWS	4
USFS	5
Other Federal	6
State	7
Private	8
Tribal	9
Foreign	0

Vegetation: The 1-digit code describing the primary vegetative cover for a particular set (row) of statistical data (see table below).

Vegetation is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Vegetation Label	*Vegetation Description*	*Veg Code*
Commercial Forest Land	Land producing or capable of producing wood products such as saw timber, posts, poles, etc., and not withdrawn from timber use.	1
Non-commercial Forest Land	Land not capable of yielding wood products or commercial forest land withdrawn from timber use.	2
Nonforest, watershed	Land which has never supported forests or has been developed for nonforest uses.	3

Burned Acres: Number of acres (rounded to the nearest tenth) that burned for a particular set (row) of statistical data, as follows:

- Wildland Fires and Natural Outs: Burned Acres represents the total area within perimeter of the fire (for a particular owner).
- Prescribed Fires: Burned Acres is the number of acres of vegetation (live or dead) altered by burning, minus any significant unaltered islands of vegetation (for a particular owner).

When summed, the Burned Acres reported in the Statistical Data section of the Individual Fire Report must match the acreage reported in the Controlled/Completed Acres field.

Burned Acres is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

LOCATION DATA FIELDS

This section of the Individual Fire Report captures data relating to the location of the incident's point of origin. In WFMI, this section appears on the main Fire Report form.

Reservation: The 3-digit number corresponding to Indian Reservation where the incident occurred (or threatened). Example – 101 (for the Colville Indian Reservation). See Appendix G for the list of Reservations and their codes.

For off-Reservation incidents, select the Reservation that is most logically associated with the incident. This might be the nearest Reservation, or for individually-owned Trust lands, the Reservation corresponding to the landowners' tribal affiliation.

In WFMI, the user selects from a pick list which shows only those Reservations associated with the Reporting Unit.

Reservation is a mandatory field for the following Incident Types: 11-15, 21-25, 48-49.

Owner: The 1-digit code describing the owner of the land where the incident originated (e.g. point of origin for a wildland fire). The Owner reported here must match one of the Owner entries in the Statistical Data Fields.

Owner is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Owner Description	*Owner Code*
BLM	1
BIA	2
NPS	3
FWS	4
USFS	5
Other Federal	6
State	7
Private	8
Tribal	9
Foreign	0

Regarding Certainty and Precision: For Wildland Fires (Type 1), Natural Outs (Type 2), and Prescribed Fires (Type 4), the fire report must specify the location of the incident's point of origin. There are two general factors – certainty and precision – that collectively determine the quality of the location data.

The certainty of location coordinate values is noted in the field labeled "Origin Accuracy", with choices indicating whether the location selected is the incident's true point of origin, probable point of origin, or a lower-confidence guess.

The precision of location coordinates is indicated by two fields – "Location Method" and the actual coordinate values. The choice selected in "Location Method" implies that a certain level of precision can be expected. For example, location coordinates that you derive from a map probably are less precise than those determined using a GPS unit. In addition, it is assumed that the coordinate values entered into the fire report have been adjusted to reflect the appropriate level of precision, given the method by which they are derived. For example, it would not be appropriate to specify a location in Decimal Degrees to five decimal places unless that coordinate value was derived from corrected GPS data. Also, the concept of *significant digits* applies, so trailing zeros should not be added indiscriminately, lest they falsely imply precision (43° 34' is obviously precise to only the nearest minute, but 43° 34' 00" is assumed to be precise to the nearest second).

Because the fire report data is used for planning and analysis, the quality of the location data is important. As shown in the table below, the best data will have a high degree of certainty (i.e. the actual point of origin was identified) and a high degree of precision (i.e. the location coordinates for that point were determined using corrected GPS data). Location data that is less certain or less precise may still be acceptable; however, location data that is both low certainty and low precision has very little value for planning. It is much better to obtain high quality location data when the fire report is first created than to try to update this information in conjunction with a planning effort later. When bad location data cannot be reliably corrected, those incidents are excluded from the planning data, thereby underreporting historic workload.

Certainty and Precision

Origin Accuracy (Certainty)	Location Method (Implied Precision)			
	Area Map	Quad Map	Raw GPS	Corrected GPS
Uncertain	Low Certainty Low Precision	Low Certainty Low-Mod. Precision	Low Certainty Mod.-High Precision	Low Certainty High Precision
General	Moderate Certainty Low Precision	Moderate Certainty Low-Mod. Precision	Moderate Certainty Mod.-High Precision	Moderate Certainty High Precision
Accurate	High Certainty Low Precision	High Certainty Low-Mod. Precision	High Certainty Mod.-High Precision	High Certainty High Precision

Following are tables that show the relationship between the digits (places) in location coordinates in various formats and their corresponding level of precision. Each table has a marker indicating the recommended level of precision needed to ensure that the location data on the fire report is of high quality and can be used (without any subsequent refinement) for planning and analysis efforts.

Format: Decimal Degrees

Decimal Digits of Degrees[1]	Approximate Precision (i.e. range represented by 1 unit of the least significant digit)				
	Horizontal Distance			Corresponding Area	
	All Latitudes	Longitude[2]			
		~ 35° Latitude	~ 45° Latitude	~ 35° Latitude	~ 45° Latitude
0	± 35 miles	± 30 miles	± 25 miles	4200 sq. mi.	3500 sq. mi.
1	± 3.5 miles	± 3 miles	± 2.5 miles	42 sq. mi.	35 sq. mi.
2	± 600 yards	± 500 yards	± 400 yards	250 ac.	200 ac.
3	± 200 feet	± 150 feet	± 130 feet	3 ac.	2.5 ac.
► 4	± 20 feet	± 15 feet	± 13 feet	1200 sq. ft.	1000 sq. ft.
5	± 2 feet	± 1.5 feet	± 1 foot	12 sq. ft.	8 sq. ft.
6	± 2 inches	± 2 inches	± 2 inches	< 1 sq. ft.	< 1 sq. ft.

Notes:
[1] The minimum precision recommended for location coordinates specified in Decimal Degrees is:
► **4 significant digits** to the right of the decimal point
[2] Because the lines of longitude converge at the poles, the distance represented by one degree of longitude decreases as latitude increases. For this table, the longitude values are shown for two broad zones, as follows:
30°-40° Latitude (Albuquerque NM, Fresno CA, Las Vegas NV, Nashville TN, Oklahoma City OK, Phoenix AZ)
40°-50° Latitude (Aberdeen SD, Billings MT, Boise ID, Minneapolis MN, Portland OR, Portland ME, Seattle WA)

Format: Degrees and Decimal Minutes

Decimal Digits of Minutes[1]	Approximate Precision (i.e. range represented by 1 unit of the least significant digit)				
	Horizontal Distance			Corresponding Area	
	All Latitudes	Longitude			
		~ 35° Latitude	~ 45° Latitude	~ 35° Latitude	~ 45° Latitude
0	± 1000 yards	± 800 yards	± 700 yards	1 sq. mi.	<1 sq. mi.
1	± 300 feet	± 250 feet	± 200 feet	7 ac.	5.5 ac.
► 2	± 30 feet	± 25 feet	± 20 feet	3000 sq. ft.	2400 sq. ft.
3	± 3 feet	± 2.5 feet	± 2 feet	30 sq. ft.	24 sq. ft.
4	± 4 inches	± 3 inches	± 3 inches	< 1 sq. ft.	< 1 sq. ft.

Notes:
[1] The minimum precision recommended for location coordinates specified in Degrees/Decimal Minutes is:
► **2 significant digits** to the right of the decimal point
[2] Because the lines of longitude converge at the poles, the distance represented by one degree of longitude decreases as latitude increases. For this table, the longitude values are shown for two broad zones, as follows:
30°-40° Latitude (Albuquerque NM, Fresno CA, Las Vegas NV, Nashville TN, Oklahoma City OK, Phoenix AZ)
40°-50° Latitude (Aberdeen SD, Billings MT, Boise ID, Minneapolis MN, Portland OR, Portland ME, Seattle WA)

Format: Degrees, Minutes, and Decimal Seconds

Decimal Digits of Seconds[1]	Approximate Precision (i.e. range represented by 1 unit of the least significant digit)				
	Horizontal Distance			Corresponding Area	
	All Latitudes	Longitude			
		~ 35° Latitude	~ 45° Latitude	~ 35° Latitude	~ 45° Latitude
► 0	± 50 feet	± 40 feet	± 35 feet	8000 sq. ft.	7000 sq. ft.
1	± 5 feet	± 4 feet	± 3.5 feet	80 sq. ft.	70 sq. ft.
2	± 6 inches	± 5 inches	± 4 inches	< 1 sq. ft.	< 1 sq. ft.

Notes:
[1] The minimum precision recommended for location coordinates specified in Degrees/Minutes/Decimal Seconds is:
► **Nearest Second (integer)**
[2] Because the lines of longitude converge at the poles, the distance represented by one degree of longitude decreases as latitude increases. For this table, the longitude values are shown for two broad zones, as follows:
30°-40° Latitude (Albuquerque NM, Fresno CA, Las Vegas NV, Nashville TN, Oklahoma City OK, Phoenix AZ)
40°-50° Latitude (Aberdeen SD, Billings MT, Boise ID, Minneapolis MN, Portland OR, Portland ME, Seattle WA)

Format: UTM Easting and Northing

Decimal Digits of Meters[1]	Approximate Precision (i.e. range represented by 1 unit of the least significant digit)	
	Horizontal Distance of Easting and Northing (all Zones)	Corresponding Area
► 0	± 0.5 meters	1 sq. meter
1	± 5 centimeters	100 sq. centimeters

Note:
[1] The minimum precision recommended for location coordinates specified in UTM is:
► **Nearest Meter (integer)**

Origin Accuracy: A descriptor (see table below for choices) that indicates the degree of accuracy that the location coordinates correspond to the actual point of origin of the fire/incident.

This qualitative assessment of accuracy essentially answers the question: How certain are we that the incident's exact point of origin has been located?

- Occasionally, the exact point of origin cannot be determined with certainty or even isolated to a high-probability site within a general area, so it is relatively uncertain whether the location coordinates correspond to the actual point of origin. Since they are assumed to correspond to a fire's point of origin (albeit a guess in some cases), the location coordinates obviously should fall within the burn perimeter.
- More commonly, the origin usually can be traced back to at least a general area, and coordinates selected to identify a point that was the probable origin within that area.
- Ideally, the exact point of origin has been determined, and its location coordinates are therefore considered accurate.
- Any other situation will require a detailed explanation.

Origin Accuracy is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Origin Accuracy Code	*Origin Accuracy Description*
Uncertain	Location coordinates are within the burn perimeter. The exact point of origin is undetermined.
General	Location coordinates correspond to the probable point of origin.
Accurate	Location coordinates correspond to the known point of origin.
Other	None of the choices above apply. Explain in Remarks.

Location Method: A descriptor (see table below for choices) that indicates the mapping method by which the location coordinates were determined.

Because each mapping method is associated with a corresponding level of precision, this field provides another qualitative assessment of the location coordinates. While the codes correspond to the most common sources or methods from which location data is derived, the code descriptions explain that these choices are broader than their literal labels. For example, when the location of a fire's point of origin is determined from a map display in GIS, the proper code to select is "Quad Map" if the base GIS data layers were derived from scanned or digitized quad maps.

Location coordinates with the least precision includes those derived from small-scale area maps, such as the USGS land use and land cover maps (1:100,000 and 1:250,000 scale), BLM surface management status maps (1:100,000 scale), USGS state maps (typically, 1:500,000 scale), USFS Forest maps (typically 1:126,720 scale), and state highway maps (scale varies, but usually much smaller than 1:100,000). More precision is expected for coordinates derived from the larger-scale quad maps, such as the USGS 7.5 minute topographic maps, orthophoto quads, and orthophoto maps (all 1:24,000 scale), plus any GIS layers that used these products for their source data. Nowadays, most location coordinates are determined on-site using GPS technology. When collected under favorable conditions, a single raw GPS coordinate is typically precise to within about 30 feet (10 meters). The best precision is obtained from corrected GPS, which includes coordinates determined by a WAAS-enabled unit, derived by averaging a large number of raw coordinates, or differentially corrected using base station data, yielding a refined coordinate that is precise to less than 3 feet (sub-meter).

Location Method is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Location Method Code	*Location Method Description*
Area Map	1:100,000 or coarser scale map or equivalent precision.
Quad Map	1:24,000 scale map or equivalent precision.
Raw GPS	Uncorrected GPS coordinates or equivalent precision.
Corrected GPS	Corrected GPS coordinates or equivalent precision.
Other	None of the choices above apply. Explain in Remarks.

Location Coordinates: For incidents with a spatial location, such a wildland fires, natural outs, and prescribed fires, a location must be identified for the point of origin. The location can be specified in either the Geographic (i.e. Latitude/Longitude) or Universal Transverse Mercator coordinate system (UTM), but not both. For both systems, the "address" of a point on the Earth is identified with a pair of coordinates, with a north-south value (Latitude or UTM Northing) and an east-west value (Longitude or UTM Easting and Zone). Both systems also require a third element – Datum – to accompany the coordinate pair.

In WFMI, the coordinate system and location coordinates are specified by the user. Once the coordinates are entered for the selected system, WFMI also calculates and stores the location information for the other coordinate system.

Please note that locations are no longer specified using the Public Land Survey System (i.e. "legal" descriptions of parcel locations).

A location coordinate set (either Latitude/Longitude or UTM coordinates, plus Datum) is mandatory for the following Incident Types: 11-16, 21-26, 48-49.

Latitude and Longitude Coordinates: The location coordinate pair for the latitude and longitude values corresponding to the incident's point of origin. The latitude and longitude coordinate pair may be expressed in one of the following formats:

Decimal degrees (including up to 6 decimal digits, as needed for precision)
The recommended level of precision requires coordinates in this format to be stated to at least 4 decimal digits, as in this example:

Latitude: 43.5675° Longitude: 116.2105°

Degrees and decimal minutes (including up to 4 decimal digits, as needed for precision)
The recommended level of precision requires coordinates in this format to be stated to at least 2 decimal digits, as in this example:

Latitude: 43° 34.05' Longitude: 116° 12.63'

Degrees, minutes, and decimal seconds (including up to 2 decimal digits, as needed for precision)
The recommended level of precision requires coordinates in this format to be stated to at least the nearest second (integer), as in this example:

Latitude: 43° 34' 03" Longitude: 116° 12' 38"

Since all BIA Reporting Units are located in North America, coordinates should be entered as positive values that will then be associated with north latitude and west longitude (in other words, do not express these western hemisphere longitudes as negative values).

UTM Coordinates: The location coordinate set for the UTM values corresponding to the incident's point of origin. The UTM coordinate set must include the following:

UTM Zone (2-digit)
UTM Easting in meters (6-digit integer, including 1 decimal digit, as needed for precision)
UTM Northing in meters (7-digit integer, including 1 decimal digit, as needed for precision)

The recommended level of precision requires coordinates in this format to be stated to at least the nearest meter (integer), as in this example:

Zone: 11 Easting: 563,751 m Northing: 4,824,141 m

Datum: Short descriptor (see table below for choices) of the geographic datum corresponding to the location coordinates.

Generally speaking, fire location coordinates read from older UGSG topographic maps are referenced in NAD27. Locations that are derived using GPS are often referenced in NAD83 or WGS84.

Selecting the wrong datum will result in minor inaccuracies (generally less than 100 meters, but enough to be of concern) when the fire origin location coordinates are plotted using GIS. Contact a GIS or GPS expert if you are not sure which datum to select.

To minimize confusion, units are encouraged to select one datum as a standard (preferably NAD83, which is the standard selected by the Federal Geographic Data Committee), and then program their GPS units to display and output all coordinates in reference to the selected datum.

Datum is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Datum Description
NAD83
NAD27
WGS84
WGS72

FIRE MANAGEMENT FIELDS

This section of the Individual Fire Report contains fields characterizing the response to an Incident. In WFMI, this section appears on the main Fire Report form.

These fields describe when an action occurred, what type of action was taken, and how big the incident was at that time.

Time and Date fields: In WFMI, date and time values are specified by the user. Dates should be expressed in MMDDYYYY format. Times should be expressed in HHMM format, using military time. To enter a time value for midnight, use “2359” or “0001” (rather than “2400” or “0000”) for the corresponding date.

Discovery/Start Date and Time: The date and time that an incident was discovered (Wildland Fire, Natural Out, Wildland Fire Use incident), initially reported (Wildland Fire, Natural Out, Wildland Fire Use incident, False Alarm), or otherwise when actions were initiated by the Reporting unit (Support Action and Management-ignited Prescribed Fire project).

Discovery/Start Date and Time are mandatory for all Incident Types.

Discovery Type: The 1-letter code corresponding to the type of resource that discovered the incident (see table below).

Discovery Type is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Discovery Code	*Discovery Type Description*
A	Bureau Lookout
B	Other Lookout
C	Bureau Fire Patrol Person
D	Other Bureau Employee
E	Cooperator Employee
F	Bureau Patrol Aircraft
G	Cooperator Patrol Aircraft
H	Other Aircraft
I	Permittee (all persons holding a use-permit or contract on Bureau lands)
J	Visitor
K	Local Resident (permanent resident living on or adjacent to Bureau lands)
L	Other (explain in Remarks)
M	Smokejumper Patrol Flight
N	Non-fire-related Bureau Flight

Discovery Acres: The fire size (rounded to the nearest tenth acre) at the time of Discovery/Start.

Discovery Acres is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Initial Attack Date and Time: The date and time when initial attack operations first commenced (Wildland Fire) or a response was initiated (Wildland Fire Use incident or False Alarm) for the incident.

Initial Attack Date and Time are mandatory fields for the following Incident Types: 11-16, 49, 51-56.

Initial Attack Type: The 1-letter code corresponding to the type of resources that performed the initial response to the incident (see table below). Up to 4 groups of resources can be identified.

Note: only report those resources that were involved in the initial response phase of the incident (i.e. if the incident exceeds initial attack, do not report those resources used during the extended attack phase).

Resource typing criteria can be found in Appendix H.

Initial Attack Type is a mandatory field for the following Incident Types: 11-16, 49, 51-56.

IA Type Code	*Initial Attack Type Description*	*IA Amount Count*
U	Aircraft – Reconnaissance	Each
K	Airtanker (Type 1)	Number of drops
J	Airtanker (Type 2)	Number of drops
I	Airtanker - SEAT (Type 3 or 4)	Number of drops
Q	Dozer (Type 1)	Each
P	Dozer (Type 2 or 3)	Each
O	Dozer (Type 4, 5, or 6)	Each
E	Engines (Type 1 or 2)	Each
D	Engines (Type 3, 4, or 5)	Each
C	Engines (Type 6 or 7)	Each
A	Explosives	Number of crews
V	Handcrew (Type 1)	Number of people
F	Handcrew (Type 2)	Number of people
N	Helicopter (Type 1)	Number of drops
M	Helicopter (Type 2)	Number of drops
L	Helicopter (Type 3 or 4)	Number of drops
H	Helitack crew	Number of people
S	Monitoring fire by air	Flights
T	Monitoring fire by ground	Person Days
W	Overhead with own vehicle	Each
B	Plows or trenchers (all Types)	Each
G	Smokejumper	Number of people
R	Watertenders	Each
X	Other equipment (describe in remarks)	Each
Y	Other firefighters (describe in remarks)	Number of people
Z	Other (none of the above, describe in remarks)	Describe in remarks

Initial Attack Amount: The quantity of resources for each Initial Attack type for each group reported in the preceding field. Quantities vary by type, as noted in the table above.

> Special Case: For an aerially-delivered resource (i.e. airtanker, helicopter equipped to make drops, smokejumper aircraft, helicopter shuttling helitack) that was dispatched but subsequently did not deliver its payload, enter 0 (zero) for the Initial Attack Amount.

Note: only count those resources that were involved in the initial response phase of the incident (i.e. if the incident exceeds initial attack, do not report those resources used during the extended attack phase).

Combined with Initial Attack Type, Initial Attack Amount is a mandatory field for the following Incident Types: 11-16, 49, 51-56.

Initial Attack Acres: The fire size (rounded to the nearest tenth acre) at the time initial response operations commenced.

Initial Attack Acres is a mandatory field for the following Incident Types: 11-16, 49.

Controlled/Completed Date and Time: The date and time when the incident was controlled (Wildland Fire) or completed (Prescribed Fire, including Wildland Fire Use incident).

Controlled/Completed Date and Time are mandatory fields for the following Incident Types: 11-16, 48-49.

Controlled/Completed Acres: The fire size (rounded to the nearest tenth acre) at the time the incident was controlled (Wildland Fire), completed (Prescribed Fire, including Wildland Fire Use incident), or otherwise assessed to have no further potential for growth (Natural Out). Acres should be counted as follows:

- Wildland Fires and Natural Outs: Burned Acres represents the total area within perimeter of the fire.
- Prescribed Fires, including Wildland Fire Use incidents: Burned Acres is the number of acres of vegetation (live or dead) altered by burning, minus any significant unaltered islands of vegetation.

The Controlled/Completed Acres reported should match the sum of the Burned Acres reported in the Statistical Data section of the Individual Fire Report.

Controlled/Completed Acres is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Declared Out Date: The date when the incident was declared out.

Declared Out Date is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

SITE DATA FIELDS

This section of the Individual Fire Report contains fields describing the incident site. In WFMI, this section appears on the main Fire Report form.

Topography: The 1-digit code describing the topography of the incident site (see table below).

For all incidents, regardless of size, this field should be used to describe the topography at the incident's point of origin.

Topography is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Topog Code	*Topography Description*
1	Ridgetop
2	Saddle
3	Upper 1/3 of slope
4	Middle 1/3 of slope
5	Lower 1/3 of slope
6	Canyon Bottom
7	Valley Bottom
8	Mesa or Plateau
9	Flat or Rolling

Aspect: The 1-digit code describing the aspect of the incident site (see table below).

For all incidents, regardless of size, this field should be used to describe the aspect at the incident's point of origin.

Aspect is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Aspect Code	*Aspect Description*
0	Flat
1	North
2	Northeast
3	East
4	Southeast
5	South
6	Southwest
7	West
8	Northwest
9	Ridgetop

Slope: The 1-digit code describing the slope class (expressed as a range, in percent) of the incident site (see table below).

For all incidents, regardless of size, this field should be used to describe the slope at the incident's point of origin.

Slope is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Slope Code	*Slope Class Description*
1	0 - 25%
2	26 - 40%
3	41 - 55%
4	56 - 75%
5	Over 75%

Elevation: The 1-digit code describing the elevation class (expressed as a range, in feet above sea level) of the incident site (see table below).

For all incidents, regardless of size, this field should be used to describe the elevation at the incident's point of origin.

Elevation is a mandatory field for the following Incident Types: 11-16, 21-26, 49.

Elev Code	*Elevation Class Description*
0	0 - 500 feet
1	501 - 1500 feet
2	1501 - 2500 feet
3	2501 - 3500 feet
4	3501 - 4500 feet
5	4501 - 5500 feet
6	5501 - 6500 feet
7	6501 - 7500 feet
8	7501 - 8500 feet
9	Over 8500 feet

Weather Station: The 6-digit National Weather Service ID for the National Fire Danger Rating System (NFDRS) weather station that best represents the predominate weather and climate conditions for the incident site.

In WFMI, the weather station ID number is entered by the user (not selected from a pick list), so users must be familiar with the weather stations used by their unit.

FBPS Fuel Model: The 2-digit code describing the predominate Fire Behavior Prediction System (FBPS) fuel model for the incident site (see table below). Descriptions of the FBPS fuel models can be found in Appendix J.

FBPS FM Code	*FBPS Fuel Model Description*
01	Short grass (1 foot)
02	Timber (grass & understory)
03	Tall grass (2.5 feet)
04	Chaparral (6 feet)
05	Brush (2 feet)
06	Dormant brush, hardwood slash
07	Southern rough
08	Closed timber litter
09	Hardwood litter
10	Timber (litter & understory)
11	Light logging slash
12	Medium logging slash
13	Heavy logging slash
14	Debris pile
15	Custom

MSGC Fuel Model: The 1-letter code describing the predominate NFDRS fuel model for the incident site (see table below). This will be combined with the other MSGC fields to create the Fuel Model/Slope Class/Grass Type/Climate Class code needed to generate NFDRS outputs.

Full descriptions of the NFDRS fuel models can be found in Appendix J. This Appendix also includes a "crosswalk" chart, which will be useful in correlating the NFDRS fuel model to the FBPS fuel model identified in the previous field.

NFDRS FM Code	*NFDRS Fuel Model Description*
A	Western annual grasses
B	Mature brush (6 feet)
C	Open pine with grass
D	Southern rough
E	Hardwood litter (Fall)
F	Intermountain-west brush
G	Dense conifer with heavy litter
H	Short-needle conifer
I	Heavy slash
J	Medium slash
K	Light slash
L	Western perennial grasses
N	Sawgrass
O	High pocosin
P	Southern long-needle pine
Q	Alaska black spruce
R	Hardwood litter (Summer)
S	Tundra
T	Sagebrush with grass
U	Western long-needle pine

MSGC Slope: The 1-digit code describing the predominate slope class (expressed as a range, in percent) for the incident site. This will be combined with the other MSGC fields to create the Fuel Model/Slope Class/Grass Type/Climate Class code needed to generate NFDRS outputs.

The MSGC Slope code reported here should match the Slope code reported previously for the incident site (see Slope field described above).

MSGC Grass: The 1-letter code describing the predominate grass type for the incident site (see table below). This will be combined with the other MSGC fields to create the Fuel Model/Slope Class/Grass Type/Climate Class code needed to generate NFDRS outputs.

Grass Code	*Grass Type Description*
A	Annual
P	Perennial

Annuals sprout from a seed each year, grow, reach maturity and die usually all in one season. This process is not affected significantly by seasonal weather factors such as temperature or precipitation. The loading of fine fuels associated with annual grasses shifts from live to dead and stays there for the duration of the season.

Perennial grasses on the other hand, generally start in a dormant condition, grow, reach maturity, then go back into dormancy. Their cycle is greatly affected by temperature and precipitation. For perennial grasses, the shift from live to dead is much slower and may even stop or reverse if the right combinations of temperature and precipitation occur during the season.

Where both annual and perennial grasses occur together, select the predominate grass type for the site.

MSGC Climate: The 1-digit code describing the climate class for the incident site (see table below). This will be combined with the other MSGC fields to create the Fuel Model/Slope Class/Grass Type/Climate Class code needed to generate NFDRS outputs.

Full descriptions and a map of the climate classes can be found in Appendix K.

Climate Code	*Climate Class Description*
1	Arid/Semi-arid
2	Sub-humid (rain deficient in Summer)
3	Sub-humid (rain adequate all year)/Humid
4	Wet

Wildland Urban Interface (WUI): A "yes" or "no" response indicating whether the incident qualifies as a "WUI fire".

A Wildland Urban Interface (WUI) fire is an unplanned, unwanted wildland fire that threatens loss of life or property within the WUI. The fire may or may not originate within the WUI.

WUI areas are areas where structures and other human development meet or intermingle with undeveloped wildland or vegetative fuels. Definitions of what constitutes a WUI area will vary from area to area. Consult the unit's Fire Management Plan to determine if WUI areas are identified. If any part of the fire falls within an identified WUI area and/or threatens a WUI area, enter "Yes"; if not, enter "No".

WUI is a mandatory field for the following Incident Types: 11-16, 21-26, 48-49.

Structures: The total number of homes and/or significant structures burned/destroyed. A significant structure is defined as a structure having an identified value, currently being used for an intended purpose, or having historical significance or artistic qualities.

Structures is a mandatory field the following Incident Types: 11-16, 21-26, 48-49.

FIRE ECOLOGY FIELDS

This section of the Individual Fire Report contains fields describing the fire regime and pre- and post-fire ecological conditions of the incident site. At least one set of data is required, and it must be entered in the first row of the form in WFMI. If needed, up to 4 additional sets of data can be specified – these should be entered in the succeeding rows.

In WFMI, this section appears on the main Fire Report form.

Note: after the initial data entry, WFMI will sort the sets (rows) of Fire Ecology data so that they are displayed in descending order according to the acreage reported for each set.

Fire Regime Group: Short descriptor of the fire regime group (see table below) for a given set (row) of fire ecology data fields.

Fire Regime Group is a mandatory field the following Incident Types: 11-16, 21-26, 48-49.

Fire Regime	*Fire Return Interval*	*Fire Severity*	*Vegetative Examples*
I	0-35 years	Low	Ponderosa pine, other long needle pine species, and dry site Douglas-fir
II	0-35 years	Stand Replacement	Drier grassland types, tall grass prairie, and some Pacific chaparral & southern rough ecosystems
III	35-100 years	Mixed	Interior dry site shrub communities such as sagebrush and chaparral ecosystems
IV	35-100 years	Stand Replacement	Lodgepole pine and jack pine
V	Over 200 years	Stand Replacement	Temperate rain forest, boreal forest, and high elevation conifer species

Pre-fire Condition Class: Short descriptor of the fire condition class that existed prior to the incident for a given set (row) of fire ecology data fields (see table below).

Pre-fire Condition Class a mandatory field the following Incident Types: 11-16, 21-26, 48-49.

Condition Class	*Short Descriptor*	*Full Description*
1	Within historical ranges	For the most part, Fire Regimes in this Fire Condition Class are within historical ranges. Vegetation composition and structure are intact. The risk of losing key ecosystem components from the occurrence of fire is relatively low. Maintenance management such as prescribed fire and/or mechanical treatments is needed to prevent these lands from becoming degraded.
2	Moderately altered from historic ranges	Fire Regimes on these lands have been moderately altered from their historical return level by either increased or decreased fire frequency. A moderate risk of losing key ecosystem components has been identified on these lands. To restore the historical fire regime, these lands may require restoration by prescribed fire, mechanical or chemical treatments, and the subsequent reintroduction of native plants.
3	Significantly altered from historic ranges	Fire Regimes on these lands have been significantly altered from their historical return interval. Vegetation condition, structure and diversity have been significantly altered. Because fire regimes have been extensively altered, the risk of losing key ecosystem components from fire is high. Consequently, these lands verge on the greatest risk of ecological collapse. To restore the historical fire regime these lands may require multiple mechanical or chemical restoration treatments before prescribed fire can be utilized to manage fuels or obtain other desired benefits.

Post-fire Condition Class: Short descriptor of the fire condition class that existed after the incident for a given set of fire ecology data fields (see table above).

Post-fire Condition Class a mandatory field the following Incident Types: 11-16, 21-26, 48-49.

Acres: Number of acres (rounded to the nearest tenth acre) within the fire perimeter corresponding to a given set (row) of fire ecology data fields.

When summed, the acres reported in the Fire Ecology section of the Individual Fire Report must match the acreage reported in the Controlled/Completed Acres field.

Fire Ecology Acres is a mandatory field the following Incident Types: 11-16, 21-26, 48-49.

GENERAL REMARKS FIELD

This section of the Individual Fire Report contains a narrative description of the incident. In WFMI, this section appears on the main Fire Report form.

SIGNATURE BLOCK FIELDS

This section of the Individual Fire Report contains fields listing information about the person(s) who provided the data on the Individual Fire Report, authorized the Individual Fire Report, and then entered it into WFMI. In WFMI, this section appears on the main Fire Report form.

The Signature Block fields are mandatory for all Incident Types.

Data Provided by (Name, Title, Month, Day, Year): The name and title of the person responsible for collecting the data for the Individual Fire Report, as well as the date when the data collection effort was completed. Usually, this is the person who prepares the draft hard-copy Individual Fire Report or equivalent forms. This person is accountable for the accuracy and completeness of the data, so you must identify a specific person by name (i.e. do not enter generic descriptors such as "ops", "dispatch", "multiple sources", etc.). Typically, this person is the Incident Commander, Situation Unit Leader, or local program manager. Identify the person's title with regard to his/her role on the incident or within the local program organization - for example, use "IC Type 4" or "Assistant FMO" rather than "Forestry Technician".

Authorized by (Name, Title, Month, Day, Year): The name and title of the person who approved the Individual Fire Report, and the date that the approval was issued. Normally, this will be the Line Officer or his/her designee (e.g. Resource Manager or FMO).

Report Entered by (Name, Title, Month, Day, Year): The name and title of the person who entered the Individual Fire Report into WFMI and the date when that occurred. Note: In WFMI, these fields are automatically populated based on the user who was logged in and the date/time when the report was initially created.

FIRE CAUSE INFORMATION FIELDS (FIRE TRESPASS SUB-FORM)

This section of the Individual Fire Report contains fields pertaining to human-caused incidents. In WFMI, this section appears on the Fire Trespass sub-form.

General/Specific Cause Codes: A 3-digit code for a valid combination of General and Specific Cause Codes that describes the cause for human-caused fires (see table below).

> Special Case: For Type 1 fire reports corresponding to escaped prescribed burns (i.e. pre-escape fire was Type 48), always use code "417: Fire Use – Resource Mgmt".

When the Cause Category is "Human", the General/Specific Cause Code fields are mandatory for the following Incident Types: 11-16.

General Code	*Specific Code*	*General – Specific Cause Description*
2	08	Campfire - Cooking/warming
2	30	Campfire - Other, unknown
2	32	Campfire - Other, known
3	10	Smoking – Smoking
4	11	Fire Use - Trash Burning
4	12	Fire Use - Burning Dump
4	13	Fire Use - Field Burning
4	14	Fire Use - Land Clearing
4	15	Fire Use - Slash Burning
4	16	Fire Use - Right-of-way
4	17	Fire Use - Resource Mgmt
4	30	Fire Use - Other, unknown
4	32	Fire Use - Other, known
5	11	Incendiary - Trash Burning
5	13	Incendiary - Field Burning
5	15	Incendiary - Slash Burning
5	18	Incendiary - Grudge Fire
5	19	Incendiary – Recurrent
5	22	Incendiary – Employment
5	23	Incendiary – Blasting
5	26	Incendiary – Fireworks
5	30	Incendiary - Other, unknown
5	32	Incendiary - Other, known
6	02	Equipment – Aircraft
6	03	Equipment – Vehicle
6	04	Equipment – Exhaust
6	07	Equipment – Brakes
6	23	Equipment – Blasting
6	25	Equipment - Power Line
6	30	Equipment - Other, unknown
6	32	Equipment - Other, known

General Code	*Specific Code*	*General – Specific Cause Description*
7	04	Railroads – Exhaust
7	07	Railroads – Brakes
7	30	Railroads - Other, unknown
7	32	Railroads - Other, known
8	19	Juveniles – Recurrent
8	26	Juveniles – Fireworks
8	27	Juveniles - Ignition Devices
8	30	Juveniles - Other, unknown
8	32	Juveniles - Other, known
9	24	Miscellaneous - Burning Building
9	26	Miscellaneous - Fireworks, Adult
9	30	Miscellaneous - Other, unknown
9	32	Miscellaneous - Other, known

Other Cause: A brief remark to further specify the cause when Specific Cause Code 32 ("Other, Known") is used above.

Fire Cause Suspect Classification: A 1-digit code describing the relationships between the person(s) who are known or suspected of causing the incident and their related activities within/near the area protected by the Reporting Unit (see table below).

When the Cause Category is "Human", the Fire Cause Suspect Classification field is mandatory for the following Incident Types: 11-16.

Suspect Class	*Fire Cause Suspect Classification Description*
1	Individuals who own land or businesses within protection boundaries
2	Special-use permittees operating within protection boundaries
3	Contractors, their agents or employees engaged in the purchase of products or construction of facilities within protection boundaries
4	Federal, State, County, Municipal, Tribal, or other public employees working within protection boundaries
5	Permanent residents living inside or within 1 mile outside protection boundary
6	Seasonal residents or workers residing inside or within 1 mile outside protection boundary
7	Tourists, motorists, campers, etc. in transit through protected area
8	People not included above (describe in Remarks section)
9	Unknown

Investigated (yes/no): A "yes" or "no" response indicating whether the cause of the incident has been formally investigated.

When the Cause Category is "Human", the Investigated field is mandatory for the following Incident Types: 11-16.

Fire Cause Suspect Identity: A short response – "known" or "unknown" – indicating whether the identity of the person(s) suspected of causing the incident is known.

When the Cause Category is "Human", the Fire Cause Suspect Identity field is mandatory for the following Incident Types: 11-16.

Fire Cause Suspect Type: A brief descriptor indicating whether the person(s) suspected of causing the incident resides within the Reporting Unit's protection boundaries (see table below).

The response here should be consistent with what was reported for the Fire Cause Suspect Classification field.

When the Cause Category is "Human", the Fire Cause Suspect Type field is mandatory for the following Incident Types: 11-16.

Suspect Type	*Suspect Type Description*
Resident	Suspect has permanent (or recurring seasonal) residence or employment within the protection boundaries
Transient	Suspect was within the protection area for a temporary period only. Includes tourists, campers, hunters, passing motorists, temporary workers, etc.
Unknown	Suspect's affiliation with the area is unknown

PROJECT INFORMATION FIELDS (FUELS MANAGEMENT SUB-FORM)

This section of the Individual Fire Report contains fields pertaining to prescribed burns and wildland fire use incidents. In WFMI, this section appears on the Fuels Management sub-form.

Local Project Number: The 6-character alpha-numeric project number (eg. H52G01) if this is a management-ignited prescribed fire in conjunction with either a hazard fuel reduction or resource management prescribed burning project. The project number identifies the agency/tribe alpha code and the special project code. This should include projects funded and unfunded by SUBSIDIARY dollars.

NFPORS Treatment Number: For incidents also documented in NFPORS, the corresponding 8-character NFPORS Treatment Number.

The NFPORS Treatment Number is a mandatory field for the following Incident Types: 48-49.

Plot/Burn Objective: A 2-digit code that describes the objective for the prescribed burn or wildland fire use incident (see table below). Up to 3 objectives can be identified, with the primary objective listed in the first row, and the other objectives listed in succeeding rows as needed.

Plot/Burn Objective is a mandatory field for the following Incident Types: 48-49.

Objective Code	*Plot/Burn Objective Description*
01	Historical Scene Maintenance
02	Other Cultural Site Maintenance
10	Exotic or Undesirable Species Control
11	Habitat Maintenance
12	Research
13	Fire Dependent Ecosystem Maintenance
14	Other
20	Fuel Reduction (Activity Fuels)
21	Fuel Reduction (Natural Fuels)
22	Real Property Protection
23	Boundary Protection
24	Fuel Break Maintenance
30	Debris Removal
31	Vista Maintenance
32	Health (Insect Control)
33	Right of Way Maintenance
40	Seed Bed Preparation
41	Veg. Type Manipulation/Stand Improvement
50	Property Protection
51	Project Maintenance

Firing Strategy: A 1-digit code describing the firing strategy for a prescribed burn (see table below). If more than one strategy was used, select the strategy that had the greatest significance with regard to the project's complexity.

Strategy Code	*Firing Strategy Description*
1	Head fire
2	Backing fire
3	Spot fire
4	Concentric fire

Firing Method: A 1-digit code describing the ignition application method for a prescribed burn (see table below). If more than one method was used, select the method that had the greatest significance with regard to the project's complexity.

Method Code	*Firing Method Description*
1	Hand ignition
2	Aerial ignition
3	Remote ignition

Cost Per Acre: The average cost per acre (in dollars and cents) for a prescribed burn or wildland fire use incident.

Escape: A "yes" or "no" response indicating whether all areas or portions of a prescribed burn and wildland fire use incident exceeded their prescriptions and were then suppressed (or otherwise managed with an appropriate management response such as a confinement or containment strategy).

If the response to this field is "yes", then a separate Individual Fire Report (i.e. Fire Type 1 – Wildland Fire Suppressed) should be prepared for the escaped portions, and the fire number for the corresponding suppression action should be documented in the spaced provided.

Escape is a mandatory field for the following Incident Types: 48-49.

Overall Treatment Complexity: A short response – "very low", "low", "medium", or "high" – corresponding to the overall complexity rating for the prescribed burn or wildland fire use incident.

The Prescribed Fire Complexity Rating System Guide and worksheet template are available online at the NWCG website.

Overall Treatment Complexity is a mandatory field for the following Incident Types: 48-49.

APPENDICES

This page was intentionally left blank.

Bureau of Indian Affairs
Fire Occurrence Reporting System – User's Guide

APPENDIX A: User Support – Contact Information

WFMI Fire Reporting Module User Support

Contact the NIFC Help Desk for technical issues regarding the Wildland Fire Management Information System web-site and the Fire reporting module. These include:

- Getting logged into the system
- Resetting a password
- Navigating the website
- Viewing, entering, and editing individual fire reports
- Generating and printing summary reports
- Generating and exporting data files

NIFC Help Desk
Phone: (208) 387-5734
Fax: (208) 387-5746
E-mail: NIFC_Help_Desk@nifc.blm.gov
The NIFC Help Desk is staffed Monday through Friday, 7:30am to 4:30pm Mountain Time. In times of peak fire activity, after-hours support may be available – call the number above for information.

Bureau of Indian Affairs Fire Occurrence Subject Matter Expert

Contact the BIA fire occurrence SME for general issues regarding fire reporting. These include:

- BIA fire reporting policy & guidelines
- Interpretation of data fields on the Individual Fire Report (DI-1202-BIA)
- Suggestions for changes to the DI-1202-BIA or WFMI
- Initial access to WFMI (e.g. getting a new user ID and password)
- Changes to WFMI access type (e.g. changing a user from viewer to editor)
- Changes to WFMI access list (e.g. adding/deleting units whose records a user can view/edit)

Primary Contact
Steve Larrabee, Fire Planner and national fire occurrence SME; BIA-NIFC
Office phone: (208) 387-5586
Fax: (208) 433-6543
Email: steve_larrabee@nifc.gov

Alternate Contacts
Other Agency fire occurrence SME's may be able to provide limited support when the Primary Contact is unavailable:

Roshelle Pederson – Bureau of Land Management fire occurrence SME
Office phone: (208) 387-5162
Fax: (208) 387-5179
Email: roshelle_pederson@blm.gov

Ed Delaney – National Park Service fire occurrence SME
Office phone: (208) 947-3752
Fax: (208) 947-3785
Email: ed_delaney@nps.gov

Fire Occurrence Reporting System – User's Guide

APPENDIX B: BIA Individual Fire Report (DI-1202-BIA)

This appendix contains the master copy of the BIA's Individual Fire Report, which can be printed and then filled-in manually (i.e. by hand, in ink) for any type of incident.

In addition, the appendix offers templates for specific incidents, based on their Incident Type (pairing of Fire Type and Protection Type). On these templates, the fields are shaded to indicate reporting requirements, as follows:

No shading: Mandatory (must report data in these fields for the report to be considered complete)
Light gray shading: Optional (report data in these fields, if desired)
Dark gray shading: Not applicable (do not report data in these fields)

APPENDIX B: BIA Individual Fire Report (DI-1202-BIA)
PART 26: Template for Incident Type 26

Following is a template of the Individual Fire Report (DI-1202-BIA) for the Incident Type (pairing of Fire Type and Protection Type) noted above. On this template, the fields are shaded to indicate reporting requirements, as follows:

No shading: Mandatory (must report data in these fields for the report to be considered complete)
Light gray shading: Optional (report data in these fields, if desired)
Dark gray shading: Not applicable (do not report data in these fields)

This page was intentionally left blank.

Template for Fire Type: 26

U.S. Department of the Interior – Bureau of Indian Affairs
INDIVIDUAL FIRE REPORT

Reporting requirements: No shading = mandatory fields; light shading = optional; dark shading = not applicable for this Fire Type.

GENERAL REPORTING INFORMATION

BIA Region	Reporting Unit	Calendar Year	Fire Number	FireCode	Fire Type / Protection Type

Incident Name	Cause Category	Burning Index

STATISTICAL DATA

Note: at least one set of statistical data is required.

No.	State	Owner	Vegetation	Burned Acres	No.	State	Owner	Vegetation	Burned Acres
1					5				
2					6				
3					7				
4					8				

LOCATION DATA

Note: Enter Lat/Lon or UTM (not both).

Reservation	Origin - Owner	Origin - Accuracy	Location - Method	Datum

Latitude			Longitude			UTM		
Degrees	Minutes	Seconds	Degrees	Minutes	Seconds	Zone	Easting	Northing

FIRE MANAGEMENT DATA

	Date	Time	Type	Amount	Acres
Discovery / Start					
Initial Attack					
Controlled / Completed					
Declared Out					

SITE DATA

Topography	Aspect	Slope	Elevation	Weather Station	FBPS Fuel Model

MSGC				Wildland Urban Interface (WUI)?	Structures
NFDRS Fuel	Slope	Grass	Climate	Yes No	Number of homes & significant structures burned/destroyed

FIRE ECOLOGY

Note: At least one set of fire ecology data is required.

No.	Fire Regime Group	Condition Class		Acres	No.	Fire Regime Group	Condition Class		Acres
		Pre-fire	Post-fire				Pre-fire	Post-fire	
1					4				
2					5				
3									

Individual Fire Report Record Identifier (Copy from page 1)	Reporting Unit	Calendar Year	Fire Number

GENERAL REMARKS

Note: Attach a topographic map showing the perimeter for fires that are 100 acres or larger.

Fire Occurrence Reporting System – User's Guide

APPENDIX D: BIA fire occurrence reporting policy and guidelines

PART 1: Excerpts Pertaining to Fire Occurrence Reporting from the BIA's 2007 Blue Book

Note: the following information was excerpted from the January 2007 release of the "Wildland Fire and Aviation Program Management and Operations Guide 2007" (aka "the Blue Book"), Chapter 4 – Program Preparedness/Readiness, Section F – Fire Occurrence Reporting, Items 1 and 2 (pages 4-12 through 4-14).

F. Fire Occurrence Reporting

1. Wildland Fire Reporting

a. The Wildland Fire Management Information (WFMI) System is the Bureau's official system of record for wildfire occurrence statistics. When wildfire occurrence data - both historic and current – is needed for planning efforts or other purposes, it will be obtained solely from WFMI. Units will be provided the opportunity to correct erroneous data in WFMI.

b. In accordance with the DOI policy that requires an interagency Fire Occurrence Reporting System (FORS), WFMI will also serves NS and BLM.

c. In 2004, NWCG launched an effort to study the requirements for fire occurrence reporting and the current systems in use. While the timetable is undefined, this effort presumably will lead to the development and implementation of an interagency FORS that will include all federal and state agencies with WFM responsibilities.

d. With these impending developments, guidance issued in the form of memoranda, technical bulletins, handbooks, and user guides may supersede the information presented below.

2. Policy

a. All local incidents; wildfires, natural outs, support actions, prescribed fire, wildland fire use, and false alarms – will have and Individual Fire Report prepared and archived as documentation. Only all-hazard incidents that are Presidential declared will require an Individual Fire Report. Reporting requirements vary by incident type and are described in the BIA *Fire Occurrence Reporting System Users Guide*.

- Because this data is used in planning to quantify a unit's workload, it is important to create a separate report for each incident that requires independent action. Generally, each ignition warrants a separate report; however, there may be instances when a single report is appropriated for multiple ignitions. For example, if a train starts three wildfires along a short distance of the track, but all three wildfires are contained within a single control perimeter, the incident may be documented with one report.

- Units should report every support action, including those incidents where support is provided to another unit. Note that this reinstates the previous policy to negate the change implemented in 2004, where support actions were not reported when responding to another unit's fire.

- Although prescribed fires and wildland fire use fires are also reported in National Fire Plan (NFP) reports and they must also be reported on an Individual Fire Report in FORS.

b. The Individual Fire Report format used by BIA is the DI-1202 BIA Fire Reporting Form.

c. The Individual Fire Report can be initiated at any time during an incident and it must be completed shortly after the incident has concluded. The completed local copy of the report may be used as a legal document and must be archived per BIA policy and guidelines.

d. Once the Individual Fire Report has been completed, the information must also be encoded into FORS.

e. Deadlines for completing the Individual Fire Report and encoding the information into FORS is as follows:

- Wildfires within 14 days after the fire is declared “out”.
- Natural outs and false alarms within 14 days after discovery or notification.
- Support actions within 14 days after all local resources have been released from the incident or other support activities have ceased.
- Prescribed fires within 14 days after project field operations have concluded.
- Wildland fire use fires within 14 days after project field operations have concluded.
- All-hazard Presidentially declared incidents within 14 days after the incident has concluded.

f. For some incidents, required data may not be available within the deadlines noted above. For example, the total incident costs may not be known until after BAER operations have been completed or the final acreage may not be known until map data has been processed in a Geographic Information System (GIS). To comply with the deadlines, such data must be estimated. However, the Individual Fire Report and FORS must be updated once the actual data becomes available.

g. In addition to the Individual Fire Report, large incidents may also require situation reports that are updated periodically. These reporting requirements are usually stipulated by unit’s GACC and/or NICC. Typically, the Incident Status Summary Form (ICS-209) is updated daily and transmitted to the unit’s respective zone or GACC.

h. In the event that is declared an escaped prescribed fire or wildland fire use fire, and is reclassified as a wildfire, separate Individual Fire Reports must be prepared. The narrative of the prescribed fire or wildland fire use report should indicate that the wildland fire was reclassified and reference the new assigned wildfire number, and report only those acres that burned with the prescription of the prescribed fire or wildland fire use fire. A new fire report is started for the newly declared wildfire and report acres burned from the point of reclassification to the declared out acres. The cause and narrative should indicate that the wildfire resulted from a prescribed fire or wildland fire use fire.

Bureau of Indian Affairs
Fire Occurrence Reporting System – User's Guide

APPENDIX E: BIA FireCode Guidance

Note: Conflicting guidance that had been issued regarding the need to complete an Individual Fire Report for Support Action incidents where support is provided to another unit has been resolved. In essence, the guidance has reverted back to the long-standing requirement to report all fire-related Support Action incidents on an Individual Fire Report.

---

3. FireCode Application

a. The FireCode System is a web-based application accessed by the dispatch community to generate a unique code that is assigned to a wildland fire incident. The FireCode will be used by all federal wildland fire management agencies to report and track costs for these activities.

b. A FireCode will be required for every wildfire (excluding prescribed and wildland fire use fires).

c. FireCode will be part of an Agency's accounting code and result in a common number to query financial systems for expenditures. The code issued from the system will be four characters, alpha/numeric.

d. The FireCode will be used in place of the fire number for all financial obligations related to fire suppression, support actions i.e., short term augmentation of resources or personnel (support actions), EFF training, severity (including USDA Forest Service severity support), BAER, and rehabilitation. The BIA National Business Center will pre-load FireCode numbers into the Federal Financial System (FFS) in place of fire numbers starting October 1, 2004.

e. The use of FireCode is an entry of fire reports into WFMI. Fire reports must be entered into WFMI.

4. FireCode Business Rules

The BIA has developed business rules and procedures to implement the FireCode System. The *FireCode System User Guide and Business Procedures* can be accessed through the BIA-NIFC office. A FireCode activity matrix is displayed in **Appendix 4-2.**

a. Wildfires occurring on BIA Trust lands (BIA/Tribal unit is the host unit).

- BIA/Tribe host unit dispatcher will access the FireCode website and enter the incident information and generate a FireCode for every wildfire. This FireCode will be used for all financial obligations charged to an incident and by all resources assigned to an incident. The FireCode is not the fire number for BIA. The fire number will continue to be the fire reporting number in WFMI. However, the FireCode will be a required entry on the fire report.
- All resource orders will include the FireCode that is assigned to an incident in the "financial code block" of the Resource Order Form.
- The FireCode will be used by the BIA in place of the Fire Number when entering an obligation to the Federal Finance System (FFS). Contract/Compact Tribes will use this code to identify all costs associated with an incident.
- When entering the accounting for obligations, the four characters from FireCode must be entered into the BIA unit'saccounting code in place of the Fire Number. Compact/Contract Tribes will use the FireCode to identify costs for wildfires when reporting to the BIA Regional office.
- A fire report must be created for each wildfire in WFMI. The fire report form will require the entry of a FireCode. If the wildfire is a false alarm you must create a fire report in WFMI, however you only have to generate one FireCode for the season. You would enter this FireCode on each false alarm fire report.

b. Wildfires occurring on BIA Trust lands in which BIA/Tribal resources are sent from other BIA/Tribal units in assistance of the incident (BIA/Tribal unit is the host unit).

- All BIA/Tribal resources responding from one BIA/Tribal unit to another BIA/Tribal unit in assistance of an incident will use the hosting BIA/Tribal unit's FireCode to charge all financial obligations. This FireCode will be used by BIA/Tribal resources as the charge code (project code) for all financial obligations related to that wildfire.

- BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.

- The FireCode will be on the Resource Order Form in the "financial code block" or will be provided by the host unit.

- When entering the accounting for obligations into FFS, the four characters from FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify their respective costs for assistance to other BIA/Tribal units when reporting to the Regional office.

c. Wildfires occurring on other federal lands in which the BIA/Tribe responds in an interagency effort or assistance action (another federal agency is the host unit).

- All BIA/Tribal resources responding to other federal agency fires will use a FireCode created by the host federal agency. This FireCode will be used by BIA/Tribal resources as the charge code (project code) for all financial obligations related to that wildfire.

- BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.

- This FireCode will be identified on the resource order form in the "financial code block" of the resource order or provided by the host agency.

- When entering the accounting for obligations the four characters from FireCode must be entered into the BIA unit's accounting code in place of the Fire Number. Compact/Contract Tribes will use the FireCode to identify their respective costs for assistance to other federal agencies when reporting to the Regional office.

d. Wildfires occurring on state lands in which the BIA/Tribe responds in an interagency effort or assistance action (state agency is the host unit).

- All BIA/Tribal resources responding to state agency wildfires will create a FireCode for each fire if a FireCode has not already been created by another Federal agency. If a FireCode has been created, the BIA/Tribal unit(s) will use that FireCode as the charge code (project code) for all financial obligations related to that wildfire.

- BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.

- If a resource order is created the FireCode will be identified in the "financial code block" of the Resource Order Form.

- When entering the accounting for obligations the four characters from FireCode must be entered into the BIA unit's accounting code in place of the Fire Number. Compact/Contract Tribes will use the FireCode to identify their respective costs for assistance to state agencies when reporting to the Regional office.

e. Actions where additional local resources are employed under operations to supplement readiness capability as a direct result of short duration high fire danger on BIA Trust lands (support action vs. long term severity).

- If needed, a BIA/Tribal unit will acquire one FireCode for the fire season to cover all local support actions related to employing additional personnel under operations to supplement local forces when in short term high fire danger.

- If a FireCode is created for local short term support actions the local unit must report the FireCode to their respective Regional office when the code is created.

- A support action fire report must be entered in WFMI and the respective FireCode entered in that fire report. The remarks section of the fire report must identify the purpose of the support action. If additional short term support needs arise through the fire season, an additional support action fire report must be created for each action. All support action fire reports created for short term support actions will use the same annual FireCode.

- When entering the accounting for obligations the four characters from the FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify their respective short term support costs when reporting to the Regional office.

f. Emergency Firefighter (EFF) Training – A FireCode will be used by all BIA units to charge obligations related to EFF training.

- BIA-NIFC will identify a unique FireCode for each BIA Regional office to be used for EFF Training within their Region. BIA units must use the designated FireCode for their respective region to charge obligations for EFF training.

- The FireCode will be used in place of the support action fire number when entering an obligation into FFS.

- When entering the accounting for obligations the 4 characters from the FireCode must be entered into the BIA unit's FFS accounting code in place of a support action fire number. Compact/Contract Tribes will use the FireCode to identify their respective EFF Training costs when reporting to the Regional office.

g. Wildfire Severity – Firecode will be used by BIA to identify all costs related to approved BIA wildfire severity actions.

- All severity requests will continue to be submitted to BIA-NIFC for approval. Upon approval, BIA-NIFC will generate a FireCode and notify the Region of the FireCode and authorized funding level.

- The FireCode will be used to charge all authorized financial obligations for readiness under the severity request

- If additional resources are ordered by BIA for severity through the interagency resource ordering process, the approved FireCode will be entered on the Resource Order Form in the "financial code block" by the BIA unit.

- If a BIA Agency/Tribe responds to another BIA Agency/Tribe severity request, the responding BIA Agency/Tribe will use the hosting Agency/Tribal unit's FireCode to charge all financial obligations.

- When entering the accounting for obligations, the 4 characters from the FireCode will be used when entering an obligation into FFS. Compact/Contract Tribes will use the FireCode to identify their respective severity costs when reporting to the Regional office.

- A support action fire report needs to be completed for severity actions.

h. USDA Forest Service Wildland Fire Severity Support – FireCode will be used by BIA to identify all costs related to severity support the USDA Forest Service severity actions.

- When BIA resources are requested in support of approved USDA Forest Service severity actions, BIA-NIFC will generate a FireCode and notify the Region of the FireCode and authorized funding level. One FireCode per Region will be established for the USDA Forest Service. Regions will use the FireCode generated for the USDA Forest Service for the fire season.

- The FireCode will be used to charge all authorized financial obligations for readiness under the severity request.

- When entering the accounting obligations, the 4 characters from FireCode will be used when entering and obligation into FFS. Compact/Contract Tribes will use the FireCode to to identify their severity rehabilitation costs when reporting to the Regional office.

- A support action fire report needs to be completed for severity support of USDA Forest Service severity actions.

i. FireCode will be used by BIA to identify all costs related to BAER actions.

- When BIA resources are requested in support of approved BIA BAER projects, BIA-NIFC will acquire a FireCode and notify the Region of the FireCode and authorized funding level.

- The FireCode will be used to charge all authorized financial obligations for BAER activities under the approved BAER plan.

- When entering the accounting obligations, the 4 characters from FireCode will be used when entering and obligation to the FFS. Compact/Contract Tribes will be used the FireCode to identify their respective BAER costs when reporting to the Regional office.

- A support action fire report needs to be completed for BAER actions.

h. FireCode will be used by BIA to identify all rehabilitation actions.

- When BIA resources are requested in support of approved BIA rehabilitaiton projects, BIA-NIFC will acquire a FireCode and notify the Region of the FireCode and authorized funding level.

- The FireCode will be used to charge all authorized financial obligations for rehabilitation activities under the approved rehabilitaion plan.

- When entering the accounting obligations, the 4 characters from FireCode will be used when entering and obligation to the FFS. Compact/Contract Tribes will be used the FireCode to identify their respective rehabilitation costs when reporting to the Regional office.

- A support action fire report does not have to be completed for rehabilitation actions.

Bureau of Indian Affairs
Fire Occurrence Reporting System – User's Guide

APPENDIX E: BIA FireCode Guidance

PART 2: Excerpt of BIA Business Rules and Procedures from the 2007 FireCode System User Guide

Note: the following information was excerpted from the Fire Code System User's Guide, dated 1/26/2007, Chapter 4 – Bureau of Indian Affairs, Agency Specific Business Rules and Procedures (pages 49 through 55).

CHAPTER 4
Bureau of Indian Affairs
Agency Specific Business Rules and Procedures

Congressional direction was given to the Department of the Interior and the Department of Agriculture, Forest Service, to standardize wildfire incident financial (project) codes. An interagency project team was formed to complete this project. The members of the project team represent the dispatch community, financial, fire operations and fire business programs. The outcome of this project has been the development of the FireCode System.

The FireCode System is a web-based application accessed by the dispatch community to generate a unique code that is assigned to a wildfire incident. In the Bureau of Indian Affairs (BIA), it is also assigned to actions to supplement resources or personnel for short periods of time (support actions), training emergency firefighters (EFF), and severity, emergency stabilization, and rehabilitation actions. The FireCodes will be used by all federal wildland fire management agencies to report and track costs for wildfire activities. The BIA will also use the FireCode System to report and track support actions, EFF training, and severity, emergency stabilization and rehabilitation activities. FireCode will be part of an Agency's accounting code and result in a common number to query financial systems for expenditures. The FireCode issued from the system will be four characters, alpha/numeric. The FireCodes will be pre-loaded into the BIA Federal Financial System (FFS) in the same manner as fire numbers were in the past.

The FireCode will be used in place of the fire number for all financial obligations related to wildfire suppression, support actions i.e., short term augmentation of resources or personnel (support actions), EFF training, and severity, emergency stabilization, and rehabilitation actions.

The BIA National Business Center pre-loads FireCode numbers into FFS in place of fire numbers. This does not preclude the entry of fire reports into the Wildland Fire Management Information (WFMI) System. Fire reports must be entered into WFMI. The following business procedures will be used to implement FireCode by all BIA wildland fire programs.

I. Wildfire Suppression

A. Wildfires occurring on BIA Trust lands (BIA/Tribal unit is the host unit).

1. BIA/Tribe host unit dispatcher will access the FireCode web site and enter the incident information and get a FireCode for every wildfire. This FireCode will be used for all financial obligations

charged to an incident and by all resources assigned to an incident. The FireCode is not the fire number for BIA. The fire number will continue to be the fire reporting number in WFMI.
2. All resource orders will include the FireCode that is assigned to an incident in the "financial code block" of the resource order form.
3. The FireCode will be used by the BIA in place of the fire number when entering an obligation into FFS. Contract/Compact Tribes will use this code to identify all costs associated with an incident.
4. When entering the accounting for obligations, the four characters from FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify costs for wildfires when reporting to the BIA Regional office.
5. A fire report must be created for each wildfire in the WFMI System. The fire report form will require the entry of a FireCode. If the wildfire is a false alarm you must create a fire report in WFMI, however you only have to generate one FireCode for the season. You would enter this FireCode on each false alarm fire report.

B. Wildfires occurring on BIA Trust lands in which BIA/Tribal resources are sent from other BIA/Tribal units in support of the incident (BIA/Tribal unit is the host unit).

1. All BIA/Tribal resources responding from one BIA/Tribal unit to another BIA/Tribal unit in support of an incident will use the hosting BIA/Tribal unit's FireCode to charge all financial obligations. This FireCode will be used by BIA/Tribal resources as the charge code (project code) for all financial obligations related to that wildfire.
2. BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.
3. The FireCode will be on the resource order form in the "financial code block" or will be provided by the host unit.
4. When entering the accounting for obligations into FFS, the four characters from FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify their respective costs for supporting other BIA/Tribal units when reporting to the Regional office.

C. Wildfires occurring on other Federal lands in which the BIA/Tribe responds in an interagency effort or support action (another Federal agency is the host unit).

1. All BIA/Tribal resources responding to other Federal agency wildfires will use a FireCode created by the host Federal agency. This FireCode will be used by BIA/Tribal resources as the charge code (project code) for all financial obligations related to that wildfire.
2. BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.
3. This FireCode will be identified on the resource order form in the "financial code block" of the resource order or provided by the host agency.
4. When entering the accounting for obligations the four characters from FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify their respective costs for supporting other Federal agencies when reporting to the Regional Office.

D. Wildfires occurring on State lands in which the BIA/Tribe responds in an interagency effort or support action (State agency is the host unit).

1. All BIA/Tribal resources responding to State Agency wildfires will create a FireCode for each wildfire if a FireCode has not already been created by another Federal agency. If a FireCode has been created, the BIA/Tribal unit(s) will use that FireCode as the charge code (project code) for all financial obligations related to that fire.

2. BIA/Tribal units will create a support action fire report in WFMI when responding to another unit's wildfire.
3. If a resource order is created the FireCode will be identified in the "financial code block" of the resource order form.
4. When entering the accounting for obligations the four characters from FireCode must be entered into the BIA unit's accounting code in place of the Fire Number. Compact/Contract Tribes will use the FireCode to identify their respective costs for supporting State agencies when reporting to the Regional office.

E. Actions where additional local resources are employed under operations to supplement readiness capability as a direct result of short duration high fire danger on BIA Trust lands (support action vs long term severity).

1. If needed, a BIA/Tribal unit will acquire one FireCode for the fire season to cover all local support actions related to employing additional personnel under operations to supplement local forces when in short term high fire danger.
2. If a FireCode is created for local short-term support actions the local unit must report the FireCode to their respective Regional office when the FireCode is created.
3. A support action fire report must be entered to WFMI and the respective FireCode entered in that fire report. The remarks section of the fire report must identify the purpose of the support action. If additional short-term support needs arise through the fire season, an additional support action fire report must be created for each action. All support action fire reports created for short-term support actions will use the same annual FireCode.
4. When entering the accounting for obligations the four characters from FireCode must be entered into the BIA unit's accounting code in place of the fire number. Compact/Contract Tribes will use the FireCode to identify their respective short-term support costs when reporting to the Regional Office.

II. Emergency Firefighter (EFF) Training

A. FireCode will be used by all BIA units to charge obligations related to EFF training.

1. The BIA-NIFC office will identify a unique FireCode for each BIA Regional office to be used for EFF Fire Training within their Region. BIA/Tribal units must use the designated FireCode for their respective Region to charge obligations for EFF training.
2. The FireCode will be used in place of the support action fire number when entering an obligation into FFS.
3. When entering the accounting for obligations the 4 characters from FireCode must be entered into the BIA unit's FFS accounting code in place of a support action fire number. Compact/Contract Tribes will use the FireCode to identify their respective EFF Training costs when reporting to the Regional office.

III. Wildland Fire Severity

A. FireCode will be used by BIA to identify all costs related to approved BIA wildland fire severity actions.

1. All severity requests will continue to be submitted to BIA-NIFC for approval. Upon approval, BIA-NIFC will generate a FireCode and notify the Region of the FireCode and authorized funding level.
2. The FireCode will be used to charge all authorized financial obligations for readiness under the severity request.

3. If additional resources are ordered by BIA for severity through the interagency resource ordering process, the approved FireCode will be entered on the resource order in the "financial code block" by the BIA host unit.
4. If a BIA Agency/Tribe responds to another BIA Agency/Tribal severity request, the responding BIA Agency/Tribe will use the hosting BIA/Tribal unit's FireCode to charge all financial obligations.
5. When entering the accounting for obligations, the four characters from FireCode will be used when entering an obligation to the FFS. Compact/Contract Tribes will use the FireCode to identify their respective severity costs when reporting to the Regional office.
6. A support action fire report needs have to be completed for severity actions.

B. FireCode will be used by BIA to identify all costs related to severity support for United States Department of Agriculture (USDA) Forest Service severity actions.

1. When BIA/Tribal resources are requested in support of approved USDA Forest Service severity actions, BIA-NIFC will generate a FireCode and notify the Region of the FireCode and authorized funding level. One FireCode per Region will be acquired for USDA Forest Service. Regions will use the FireCode generated for the USDA Forest Service for the fire season.
2. The FireCode will be used to charge all authorized financial obligations for readiness under the severity request.
3. When entering the accounting obligations, the four characters from FireCode will be used when entering and obligation to the FFS. Compact/Contract Tribes will use the FireCode to identify their respective severity costs when reporting to the Regional office.
4. A support action fire report needs to be completed for severity support of USDA Forest Service severity actions.

IV. Burned Area Emergency Response (BAER)

A. FireCode will be used by BIA to identify all costs related to approved BIA BAER actions.

1. When BIA/Tribal resources are requested in support of approved BIA/Tribal BAER projects, BIA-NIFC will acquire a FireCode and notify the Region of the FireCode and authorized funding level.
2. The FireCode will be used to charge all authorized financial obligations for BAER activities under the approved BAER plan.
3. When entering the accounting obligations, the four characters from FireCode will be used when entering and obligation to the FFS. Compact/Contract Tribes will use the FireCode to identify their respective BAER costs when reporting to the Regional office.
4. A support action fire report needs to be completed for BAER actions.

V. Rehabilitation

A. FireCode will be used by BIA to identify all costs related to approved BIA rehabilitation actions.

1. When BIA resources are requested in support of approved BIA/Tribal BAER projects, BIA-NIFC will acquire a FireCode and notify the Region of the FireCode and authorized funding level.
2. The FireCode will be used to charge all authorized financial obligations for rehabilitation activities under the approved rehabilitation plan.
3. When entering the accounting obligations, the four characters from FireCode will be used when entering and obligation to the FFS. Compact/Contract Tribes will use the FireCode to identify their respective rehabilitation costs when reporting to the Regional office.
4. A support action fire report does not have to be completed for rehabilitation actions.

BIA FireCode Activity Matrix

Description of Activity	Responsibility For Generating A FireCode			
Action	**BIA Host Unit**	**Host Federal Agency**	**First Federal Agency to Respond**	**BIA-NIFC**
A. Fires occurring on BIA Trust lands (BIA/Tribal unit is the host unit). (92310)	X			
B. Fires occurring on BIA Trust lands in which BIA/Tribal resources are sent from other BIA/Tribal units in support of the incident (BIA/Tribal unit is the host unit). (92310)	X			
C. Fires occurring on other Federal lands in which the BIA/Tribe responds in an interagency effort or support action (another Federal agency is the host unit). (92310)		X		
D. Fires occurring on State lands in which the BIA/Tribe responds in an interagency effort or support action (State agency is the host unit). (92310)			X	
E. Actions where additional local resources are employed under operations to supplement readiness capability as a direct result of short duration high fire danger on BIA Trust lands (support action vs long term severity) (1-FireCode per season per Agency/Tribe, notify Regional Office).(92310)	X			
F. FireCode will be used by all BIA units to charge obligations related to EFF training (1 FireCode per Region for the season).(92310)				X
G. FireCode will be used by BIA to identify all cost related to approved BIA wildland fire severity actions and support of USDA Forest Service and Department of the Interior agencies severity actions(92350)				X
H. FireCode will be used by BIA units to identify all costs related to approved BAER actions. (92320)				X
I. FireCode will be used by all BIA units to identify all costs related to approved rehabilitation actions. (92B20)				X

APPENDIX F: BIA and Tribal Reporting Units

Following are the BIA and Tribal Reporting Units:

Unit ID	Reporting Unit Name
AKAKA	Alaska Regional Office

BIA - NIFC	
Unit ID	**Reporting Unit Name**
IDFCA	BIA - NIFC

Eastern Oklahoma Region	
Unit ID	**Reporting Unit Name**
OKCHA	Chickasaw Agency
OKCNA	Cherokee Nation Tribe
OKEOA	Eastern Oklahoma Regional Office
OKMIA	Miami Agency
OKOMA	Okmulgee Field Office
OKOSA	Osage Agency
OKTLA	Talihina Agency
OKWEA	Wewoka Agency

Eastern Region	
Unit ID	**Reporting Unit Name**
FLMIA	Miccosukee Tribe
FLSEA	Seminole Agency
MAWAA	Wampanoag Tribe
MEMAA	Maliseet Tribe
MEPAA	Passamaquoddy Tribe
MEPEA	Penobscot Nation
MSCHA	Choctaw Agency
NCECA	Eastern Cherokee Agency
RINAA	Narragansett Tribe
TNEAA	Eastern Regional Office

Unit ID	Reporting Unit Name
NDFBA	Fort Berthold Agency
NDFTA	Fort Totten Agency
NDSRA	Standing Rock Agency
NDTMA	Turtle Mountain Agency
NEWIA	Winnebago Agency
SDCCA	Crow Creek Agency
SDCRA	Cheyenne River Agency
SDFSA	Flandreau Santee
SDGPA	Great Plains Regional Office
SDLBA	Lower Brule Agency
SDPRA	Pine Ridge Agency
SDRBA	Rosebud Agency
SDSIA	Sisseton Agency
SDYAA	Yankton Agency

Midwest Region	
Unit ID	**Reporting Unit Name**
IASFA	Sac and Fox Agency
MIGTA	Grand Traverse Tribe
MIMIA	Michigan Field Office
MNBFA	Bois Forte Tribe
MNFDA	Fond du Lac Tribe
MNGPA	Grand Portage Tribe
MNMLA	Mille Lacs
MNMNA	Minnesota Agency
MNMRA	Midwest Regional Office
MNRLA	Red Lake Agency
WIGLA	Great Lakes Agency
WIMEA	Menominee Tribe

Navajo Region	
Unit ID	**Reporting Unit Name**
AZNAA	Navajo Regional Office

Northwest Region	
Unit ID	**Reporting Unit Name**
AKMEA	Metlakatla Agency
IDFHA	Fort Hall Agency
IDNIA	Northern Idaho Agency
IDNPT	Nez Perce Tribe
MTFHA	Flathead Agency
ORGRT	Grand Ronde Tribes
ORNWA	Northwest Regional Office
ORSIA	Siletz Agency
ORUMA	Umatilla Agency
ORWSA	Warm Springs Agency
WACOA	Colville Agency
WALUT	Lummi Tribe
WAMAA	Makah Agency
WAOPA	Olympic Peninsula Agency
WAPSA	Puget Sound Agency
WAQNT	Quinault Nations Tribe
WASPA	Spokane Agency
WASWT	Swinomish Tribe
WAYAA	Yakama Agency

Pacific Region	
Unit ID	**Reporting Unit Name**
CACAA	Cabazon Tribe
CACCA	Central California Agency
CAHIA	Hoopa Valley Tribe
CANCA	Northern California Agency
CAPAA	Pacific Regional Office
CARVA	Round Valley Tribe
CASCA	Southern California Agency
CATRA	Tule River Tribe

Rocky Mountain Region	
Unit ID	**Reporting Unit Name**
MTBFA	Blackfeet Agency
MTCRA	Crow Agency
MTFBA	Fort Belknap Agency
MTFPA	Fort Peck Agency
MTNCA	Northern Cheyenne Agency
MTRBA	Rocky Boy's Agency
MTRMA	Rocky Mountain Regional Office
WYWRA	Wind River Agency

Southern Plains Region	
Unit ID	**Reporting Unit Name**
KSHOA	Horton Agency
OKANA	Anadarko Agency
OKCOA	Concho Field Office
OKKIA	Kickapoo Field Office
OKPAA	Pawnee Agency
OKSPA	Southern Plains Regional Office
TXACA	Alabama-Coushatta Tribe

Southwest Region	
Unit ID	**Reporting Unit Name**
COSUA	Southern Ute Agency
COUMA	Ute Mountain Ute Agency
NMJIA	Jicarilla Agency
NMLAA	Laguna Agency
NMMEA	Mescalero Agency
NMNPA	Northern Pueblos Agency
NMRNA	Ramah Navajo Agency
NMSPA	Southern Pueblos Agency
NMSWA	Southwest Regional Office
NMZUA	Zuni Agency

Western Region	
Unit ID	**Reporting Unit Name**
AZCRA	Colorado River Agency
AZFTA	Fort Apache Agency
AZFYA	Fort Yuma Agency
AZHOA	Hopi Agency
AZPMA	Pima Agency
AZPPA	Papago Agency
AZSCA	San Carlos Agency
AZSRA	Salt River Agency
AZTCA	Truxton Canyon Agency
AZWEA	Western Regional Office
NVDVT	Sho-Pai Tribes
NVENA	Eastern Nevada Agency
NVWNA	Western Nevada Agency
UTSPA	Southern Paiute Agency
UTUOA	Uintah and Ouray Agency

APPENDIX G: Reservation Codes

Following are the Reservation (Area) Codes and the Reporting Units with which they are associated:

Alaska Region		
Unit ID	**Reservation**	**Code**
AKAKA	All Reservations	999

Eastern Region		
Unit ID	**Reservation**	**Code**
FLMIA	Miccosukee	026
FLSEA	Brighton	012
	Big Cypress	013
	Immokalee	025
MAWAA	Wampanoag	030
MEMAA	Maliseet	019
MEPAA	Passamaquoddy (Ind.Tnsp/Pleas.Pt)	014
MEPEA	Penobscot	018
MSCHA	Mississippi Choctaw	980
NCECA	Eastern Cherokee	010
RINAA	Narragansett	027
TNEAA	All Reservations in this table, plus:	
	Catawba	032
	Coushatta (LA)	971
	Micmac	031
	Mohegan	033
	Pequot	020
	Poarch Creek	028
	Seneca Nation (Alle/Catt/Oil Spr)	004
	St. Regis (Mohawk)	007
	Tunica	336

Eastern Oklahoma Region		
Unit ID	**Reservation**	**Code**
OKCHA	Chickasaw	906
OKCNA	Tahlequah-Cherokee	905
OKEOA	All Reservations in this table	
OKMIA	Eastern Shawnee	921
	Modoc	927
	Ottawa	922
	Peoria	926
	Quapaw	920
	Seneca-Cayuga	923
	Western Miami	925
	Wyandotte	924
OKOMA	Creek	908
OKOSA	Osage	930
OKWEA	Seminole	909
OKTLA	Talihina-Choctaw	907

Great Plains Region		
Unit ID	**Reservation**	**Code**
NDFBA	Fort Berthold	301
NDFTA	Fort Totten	303
NDSRA	Standing Rock	302
NDTMA	Turtle Mountain	304
NEWIA	Omaha	380
	Santee Sioux	382
	Winnebago	383
SDCCA	Crow Creek	342
SDCRA	Cheyenne River	340
SDFSA	Flandreau	341
SDGPA	All Reservations in this table	
SDLBA	Lower Brule	343
SDPRA	Pine Ridge	344
SDRBA	Rosebud	345
SDSIA	Sisseton	347
SDYAA	Yankton	346

Midwest Region		
Unit ID	**Reservation**	**Code**
IASFA	Sac and Fox	490
MIGTA	Grand Traverse	468
MIMIA	Bay Mills	470
	Grand Traverse	468
	Gun Lake	484
	Hannaville	471
	Huron Potawatomi	478
	Isabella	472
	Keweenaw Bay Indian Community	475
	Lac Vieux	479
	Little River	482
	Little Traverse	483
	Pokagon	480
	Sault Ste. Marie	469
MNBFA	Bois Forte	404
MNFDA	Fond Du Lac	405
MNGPA	Grand Portage	406
MNMLA	Mille Lacs	410
MNMNA	Bois Forte	404
	Fond Du Lac	405
	Grand Portage	406
	Leech Lake	407
	Mille Lacs	410
	White Earth	408
MNMRA	All Reservations in this table	
MNRLA	Red Lake	409
WIGLA	Bad River	430
	Forest County Potawatomi	434
	Lac Courte Oreilles	431
	Lac Du Flambeau	432
	Minnesota Winnebago	460
	Oneida	433
	Other Wisconsin Reservations	998
	Red Cliff	435
	Sokaogan Chippewa	437
	Stockbridge Munsee	438
	Wisconsin Winnebago	439
WIMEA	Menominee	440

Navajo Region		
Unit ID	**Reservation**	**Code**

APPENDIX H: Criteria for Firefighting Resource Types

Tractor-Plows

Component	Minimum Standards for Type					
	Type 1	**Type 2**	**Type 3**	**Type 4**	**Type 5**	**Type 6**
Horsepower	165	140	120	90	70-80	42-60
Examples	D-7 JD-850 TD-20 and larger	D-6 JD-750 TD-15 Case 1450	D-5H, D-4H TD-12 Case 1150	D-4, D-5C JD-650 TD-9	D-4C JD-450 TD-8	D-3 JD-400, JD-350 TD-7

Dozers

Component	Minimum Standards for Type		
	Type 1 (Heavy)	**Type 2** (Medium)	**Type 3** (Light)
Horsepower	200	100	50
Examples	D-8H, D-7H JD-850	D-5H JD-650	D-46, D-3 JD-550

Engines

Component	Minimum Standards for Type						
	Structure Engines		Wildland Engines				
	Type 1 (Heavy)	**Type 2** (Heavy)	**Type 3** (Heavy)	**Type 4** (Medium)	**Type 5** (Medium)	**Type 6** (Light)	**Type 7** (Light/Slip-on)
Pump Rating Minimum flow (GPM) At rated pressure (PSI)	 1000+ 150	 250+ 150	 150 250	 50 100	 50 100	 30 100	 10 100
Tank Capacity (gallons)	400+	400+	500+	750+	400-750	150-400	50-200
Hose, 2½" (feet)	1200	1000	--	--	--	--	--
Hose, 1½" (feet)	400	500	500	300	300	300	--
Hose, 1" (feet)	--	--	500	300	300	300	200
Ladders (feet)	48	48	--	--	--	--	--
Master Stream (GPM)	500	--	--	--	--	--	--
Personnel (minimum)	4	3	3	2	2	2	2

Watertenders

Component	Minimum Standards for Type		
	Type 1	**Type 2**	**Type 3**
Tank Capacity (gallons)	5000+	2500+	1000+
Pump Capacity (GPM)*	300+	200+	200+
Off Load Capacity (GPM)	300+	200+	200+
Max. Refill Time (minutes)	30	20	15
	Notes: * Portable pump acceptable.		

Air Tankers

Component	Minimum Standards for Type			
	Type 1 (Heavy)	**Type 2** (Heavy)	**Type 3** (Mixed)	**Type 4** (SEAT)
Tank Capacity (gallons)	3000	1800	800	100
Examples	C-130 P-3 DC-7	DC-4 SP2H P2V	Grumman S-2 CL-215 CL-415 AT-802F	Thrush S-2R Melex M-18 AT-802

Helicopters

Component	Minimum (unless otherwise noted) Standards for Type		
	Type 1 (Heavy)	**Type 2** (Medium)	**Type 3** (Light)
Allowable Payload at 59ºF at Sea Level (lbs)	5000	2500	1200
Passenger Seats	15+	9-14	4-8
Retardant or Water Carrying Capability (gallons)	700	300	100
Maximum Gross Takeoff/Landing Weight (lbs)	12,501+	6000-12,500	Up to 6000
Examples	B-214 series S-58/61/62/64/70 CH-54, UH-60 BV-107/234 SA-330J, AS-332 K-Max, H-43F	B-204/205/210/212 MD-900 S-55	B-206 series/407 MD-500 SA-315/316 AS-350 series/355 EC-135
Helitanker	- Fixed Tank - Air Tanker Board Certified - 1100 gal. Minimum Capacity		

Handcrews

Component	Minimum Standards for Type			
	Type I [1]	**Type II with IA Capability**	**Type II**	**Type III**
Fireline Capability	Initial attack/can be broken up into squads, fireline construction, complex firing operations (backfire)	Initial attack/can be broken up into squads, fireline construction, firing to include burnout	Initial attack, fireline construction, firing to include burnout	Fireline construction, fireline improvement, mop-up and rehab
Crew Size	18-20	18-20	18-20	18-20
Leadership Qualifications	Permanent Supervision 1 Superintendent: TFLD, ICT4 1 Asst Supt: STCR, ICT4 3 Squad Boss: CRWB(T), ICT5	1 CRWB and 3 ICT5	1 CRWB and 3 FFTR1	1 CRWB and 3 FFTR1
Bilingual Requirement	CRWB and FFT1's must be bilingual (able to read and interpret) in the primary language of crew.	CRWB and FFT1's must be bilingual (able to read and interpret) in the primary language of crew.	CRWB and FFT1's must be bilingual (able to read and interpret) in the primary language of crew.	CRWB and FFT1's must be bilingual (able to read and interpret) in the primary language of crew.
Experience	80% - 1 season or more	60% - 1 season or more	40% - 1 season or more	20% - 1 season or more
Full Time Organized Crew	Yes	No	No	No
Communications	5 programmable radios	4 programmable radios	4 programmable radios	4 programmable radios
Sawyers	3 agency qualified	3 agency qualified	0	0
Training	80 hours annual training	Basic firefighter training and/or annual firefighter safety refresher	Basic firefighter training and/or annual firefighter safety refresher	Basic firefighter training and/or annual firefighter safety refresher

FUEL MODEL DESCRIPTIONS

Grass Group

Fire Behavior Fuel Model 1
Fire spread is governed by the fine, very porous, and continuous herbaceous fuels that have cured or are nearly cured. Fires are surface fires that move rapidly through the cured grass and associated material. Very little shrub or timber is present, generally less than one-third of the area.

Grasslands and savanna are represented along with stubble, grass-tundra, and grass-shrub combinations that meet the above area constraint. Annual and perennial grasses are included in this fuel model.

This fuel model correlates to 1978 NFDRS fuel models A, L, and S.

Fire Behavior Fuel Model 2
Fire spread is primarily through the fine herbaceous fuels, either curing or dead. These are surface fires where the herbaceous material, in addition to litter and dead/down stemwood from the open shrub or timber overstory, contribute to the fire intensity.

Open shrub lands and pine stands or scrub oak stands that cover one-third to two-thirds of the area may generally fit this model; such stands may include clumps of fuels that generate higher intensities and that may produce firebrands. Some pinyon-juniper may be in this model.

This fuel model correlates to 1978 NFDRS fuel models C and T.

Fire Behavior Fuel Model 3
Fires in this fuel are the most intense of the grass group and display high rates of spread under the influence of wind. Wind may drive fire into the upper heights of the grass and across standing water.

Stands are tall, averaging about 3 feet (1 m), but considerable variation may occur. Approximately one-third or more of the stand is considered dead or cured and maintains the fire. Wild or cultivated grains that have not been harvested can be considered similar to tall prairie and marshland grasses.

This fuel correlates to 1978 NFDRS fuel model N.

Shrub Group

Fire Behavior Fuel Model 4
Fires intensity and fast-spreading fires involve the foliage and live and dead fine woody material in the crowns of a nearly continuous secondary overstory.

Stands of mature shrubs, 6 or more feet tall, such as California mixed chaparral, the high pocosin along the east coast, the pinebarrens of New Jersey, or the closed jack pine stands of the north-central States are typical candidates. Besides flammable foliage, dead woody material in the stands significantly contributes to the fire intensity. Height of stands qualifying for this model depends on local conditions. A deep litter layer may also hamper suppression efforts.

This fuel model represents 1978 NFDRS fuel models B and O; fire behavior estimates are more severe than obtained by models B or O.

Fire Behavior Fuel Model 5
Fire is generally carried in the surface fuels that are made up of litter cast by the shrubs and the grasses or forbs in the understory. The fires are generally not very intense because surface fuel loads are light, the shrubs are young with little dead material, and the foliage contains little volatile material.

Usually shrubs are short and almost totally cover the area. Young, green stands with no dead wood would qualify: laurel, vine maple, alder, or even chaparral, manzanita, or chamise.

No 1978 NFDRS fuel model is represented, but model 5 can be considered as a second choice for NFDRS model D or as a third choice for NFDRS model T.

Fire Behavior Fuel Model 6
Fires carry through the shrub layer where the foliage is more flammable than fuel model 5, but this requires moderate winds, greater than 8 mi/h (13 km/h) at midflame height. Fire will drop to the ground at low wind speeds or at openings in the stand.

The shrubs are older, but not as tall as shrub types of model 4, nor do they contain as much fuel as model 4. A broad range of shrub conditions is covered by this model. Fuel situations to be considered include intermediate stands of chamise, chaparral, oak brush, low pocosin, Alaskan spruce taiga, and shrub tundra. Even hardwood slash that has cured
can be considered. Pinyon-juniper shrublands may be represented but may overpredict rate of spread except at high winds, like 20 mi/h (32 km/h) at the 20-foot level.

The 1978 NFDRS fuel models F and Q are represented by this fuel model. It can be considered a second choice for models T and D and a third choice for model S.

Fire Behavior Fuel Model 7
Fires burn through the surface and shrub strata with equal ease and can occur at higher dead fuel moisture contents because of the flammability of live foliage and other live material.

Stands of shrubs are generally between 2 and 6 feet (0.6 and 1.8 m) high. Palmetto-gallberry understory-pine overstory sites are typical and low pocosins may be represented. Black spruce-shrub combinations in Alaska may also be represented.

This fuel model correlates with 1978 NFDRS model D and can be a second choice for model Q.

Timber Group

Fire Behavior Fuel Model 8
Slow-burning ground fires with low flame lengths are generally the case, although the fire may encounter an occasional "jackpot" or heavy fuel concentration that can flare up. Only under severe weather conditions involving high temperatures, low humidities, and high winds do the fuels pose fire hazards.

Closed canopy stands of short-needle conifers or hardwoods that have leafed out support fire in the compact litter layer. This layer is mainly needles, leaves, and occasionally twigs because little undergrowth is present in the stand. Representative conifer types are white pine, and lodgepole pine, spruce, fir, and larch.

This model can be used for 1978 NFDRS fuel models H and R.

Fire Behavior Fuel Model 9
Fires run through the surface litter faster than model 8 and have longer flame height. Both long-needle conifer stands and hardwood stands, especially the oak-hickory types, are typical. Fall fires in hardwoods are predictable, but high winds will actually cause higher rates of spread than predicted because of spotting caused by rolling and blowing leaves.

Closed stands of long-needled pine like ponderosa, Jeffrey, and red pines, or southern pine plantations are grouped in this model. Concentrations of dead-down woody material will contribute to possible torching out of trees, spotting, and crowning.

NFDRS fuel models E, P, and U are represented by this model. It is also a second choice for models C and S.

Fire Behavior Fuel Model 10
The fires burn in the surface and ground fuels with greater fire intensity than the other timber litter models. Dead-down fuels include greater quantities of 3-inch (7.6-cm) or larger limbwood resulting from overmaturity or natural events that create a large load of dead material on the forest floor. Crowning out, spotting, and torching of individual trees are more frequent in this fuel situation, leading to potential fire control difficulties.

Any forest type may be considered if heavy down material is present; examples are insect- or disease-ridden stands, windthrown stands, overmature situations with deadfall, and aged light thinning or partial-cut slash.

The 1978 NFDRS fuel model G is represented and is depicted in photographs 28, 29, and 30.

Logging Slash Group

Fire Behavior Fuel Model 11
Fires are fairly active in the slash and herbaceous material intermixed with the slash. The spacing of the rather light fuel load, shading from overstory, or the aging of the fine fuels can contribute to limiting the fire potential.

Light partial cuts or thinning operations in mixed conifer stands, hardwood stands, and southern pine harvests are considered. Clearcut operations generally produce more slash than represented here. The less-than-3-inch (7.6-cm) material load is less than 12 tons per acre (5.4 t/ha). The greater-than-3-inch (7.6-cm) is represented by not more than 10 pieces, 4 inches (10.2 cm) in diameter, along a 50-foot (15-m) transect.

The 1978 NFDRS fuel model K is represented by this model.

Fire Behavior Fuel Model 12
Rapidly spreading fires with high intensities capable of generating firebrands can occur. When fire starts, it is generally sustained until a fuel break or change in fuels is encountered.

The visual impression is dominated by slash and much of it is less than 3 inches (7.6 cm) in diameter. The fuels total less than 35 tons per acre (15.6 t/ha) and seem well distributed. Heavily thinned conifer stands, clearcuts, and

medium or heavy partial cuts are represented. The material larger than 3 inches (7.6 cm) is represented by encountering 11 pieces, 6 inches (15.2 cm) in diameter, along a 50-foot (15-m) transect.

This model depicts 1978 NFDRS model J and may overrate slash areas when the needles have dropped and the limbwood has settled. However, in areas where limbwood breakup and general weathering have started, the fire potential can increase.

Fire Behavior Fuel Model 13
Fire is generally carried across the area by a continuous layer of slash. Large quantities of material larger than 3 inches (7.6 cm) are present. Fires spread quickly through the fine fuels and intensity builds up more slowly as the large fuels start burning. Active flaming is sustained for long periods and a wide variety of firebrands can be generated. These contribute to spotting problems as the weather conditions become more severe.

Clearcuts and heavy partial-cuts in mature and overmature stands are depicted where the slash load is dominated by the greater-than-3-inch (7.6-cm) diameter material. The total load may exceed 200 tons per acre (89.2 t/ha) but fuel less than 3 inches (7.6-cm) is generally only 10 percent of the total load. Situations where the slash still has “red” needles attached but the total load is lighter, more like model 12, can be represented because of the earlier high intensity and quicker area involvement.

The 1978 NFDRS fuel model I is represented. Areas most commonly fitting this model are old-growth stands west of the Cascade and Sierra Nevada Mountains. More efficient utilization standards are decreasing the amount of large material left in the field.

For other slash situations:
Hardwood slash ..... Model 6
Heavy “red” slash ..... Model 4
Overgrown slash ..... Model 10
Southern pine clearcut slash ..... Model 12

Fire Occurrence Reporting System – User's Guide

APPENDIX J: Fuel Models

PART 2: Description of the National Fire Danger Rating System (NFDRS) Fuel Models

The following information was excerpted from: John E. Deeming, Robert E. Burgan, and Jack D. Cohen; "The National Fire-Danger Rating System—1978;" General Technical Report, INT-39; USDA Forest Service, Intermountain Forest and Range Experiment Station; Odgen, UT; 1977; 63 p.

The National Fire Danger Rating System - 1978 Fuel Model Definitions	
Fuel Model A	This fuel model represents western grasslands vegetated by annual grasses and forbs. Brush or trees may be present but are very sparse, occupying less than a third of the area. Examples of types where Fuel Model A should be used are cheatgrass and medusahead. Open pinyon-juniper, sagebrush-grass, and desert shrub associations may appropriately be assigned this fuel model if the woody plants meet the density criteria. The quantity and continuity of the ground fuels vary greatly with rainfall from year to year.
Fuel Model B	Mature, dense fields of brush 6 feet or more in height are represented by this fuel model. One-fourth or more of the aerial fuel in such stands is dead. Foliage burns readily. Model B fuels are potentially very dangerous, fostering intense fast-spreading fires. This model is for California mixed chaparral generally 30 years or older. The F model is more appropriate for pure chamise stands. The B model may be used for the New Jersey pine barrens.
Fuel Model C	Open pine stands typify Model C fuels. Perennial grasses and forbs are the primary ground fuel but there is enough needle litter and branchwood present to contribute significantly to the fuel loading. Some brush and shrubs may be present but they are of little consequence. Situations covered by Fuel Model C are open, longleaf, slash, ponderosa, Jeffrey, and sugar pine stands. Some pinyon-juniper stands may qualify.
Fuel Model D	This fuel model is specifically for the palmetto-gallberry understory-pine overstory association of the southeast coastal plains. It can be also used for the so-called "low pocosins" where Fuel Model O might be too severe. This model should only be used in the Southeast because of a high moisture of extinction.
Fuel Model E	Use this model after leaf fall for hardwood and mixed hardwood-conifer types where the hardwoods dominate. The fuel is primarily hardwood leaf litter. The oak-hickory types are best represented by Fuel Model E, but E is an acceptable choice for northern hardwoods and mixed forests of the Southeast. In high winds, the fire danger may be underrated because rolling and blowing leaves are not accounted for. In the summer after the trees have leafed out, Fuel Model E should be replaced by fuel Model R.

Fuel Model F	Fuel Model F is the only one of the 1972 NFDRS Fuel Models whose application has changed. Model F now represents mature closed chamise stands and oakbrush fields of Arizona, Utah, and Colorado. It also applies to young, closed stands and mature, open stands of California mixed chaparral. Open stands of pinyon-juniper are represented; however, fire activity will be overrated at low windspeeds and where there is sparse ground fuels.
Fuel Model G	Fuel Model G is used for dense conifer stands where there is a heavy accumulation of litter and downed woody material. Such stands are typically overmature and may also be suffering insect, disease, wind, or ice damage -- natural events that create a very heavy buildup of dead material on the forest floor. The duff and litter are deep and much of the woody material is more than 3 inches in diameter. The undergrowth is variable, but shrubs are usually restricted to openings. Types meant to be represented by Fuel Model G are hemlock-Sitka spruce, Coast Douglas-fir, and windthrown or bug-killed stands of lodgepole pine and spruce.
Fuel Model H	The short-needled conifers (white pines, spruces, larches, and firs) are represented by Fuel Model H. In contrast to Model G fuels, Fuel Model H describes a healthy stand with sparse undergrowth and a thin layer of ground fuels. Fires in H fuels are typically slow spreading and are dangerous only in scattered areas where the downed woody material is concentrated.
Fuel Model I	Fuel Model I was designed for clear-cut conifer slash where the total loading of materials less than 6 inches in diameter exceeds 25 tons/acre. After settling and the fines (needles and twigs) fall from the branches, Fuel Model I will overrate the fire potential. For lighter loadings of clear-cut conifer slash, use Fuel Model J, and for light thinnings and partial cuts where the slash is scattered under a residual overstory, use Fuel Model K.
Fuel Model J	This model complements Fuel Model I. It is for clearcuts and heavily thinned conifer stands where the total loading of materials less than 6 inches in diameter is less than 25 tons/acre. Again, as the slash ages, the fire potential will be overrated.
Fuel Model K	Slash fuels from light thinnings and partial cuts in conifer stands are represented by Fuel Model K. Typically the slash is scattered about under an open overstory. This model applies to hardwood slash and to southern pine clearcuts where the loading of all fuels is less than 15 tons/acre.
Fuel Model L	This fuel model is meant to represent western grasslands vegetated by perennial grasses. The principal species are coarser and loadings heavier than those in Model A fuels. Otherwise the situations are very similar; shrubs and trees occupy less than one-third of the area. The quantity of fuel in these areas is more stable from year to year. In sagebrush areas Fuel Model T may be more appropriate.
Fuel Model N	This fuel model was constructed specifically for the sawgrass prairies of south Florida. It may be useful in other marsh situations where the fuel is coarse and reedlike. This model assumes that one-third of the aerial portion of the plants are dead. Fast-spreading, intense fires can occur even over standing water.
Fuel Model O	The O fuel model applies to dense, brushlike fuels of the Southeast. O fuels, except for the deep litter layer, are almost entirely living in contrast to B fuels. The foliage burns readily except during the active growing season. The plants are typically over 6 feet tall and are often found under an open stand of pine. The pocosins of the Virginia, North and South Carolina coasts are the ideal of Fuel Model O. If the plants do not meet the 6-foot criteria in those areas, Fuel Model D should be used.

Fuel Model P	Closed, thrifty stands of long-needled southern pines are characteristic of P fuels. A 2- to 4-inch layer of lightly compacted needle litter is the primary fuel. Some small diameter branchwood is present but the density of the canopy precludes more than a scattering of shrubs and grass. Fuel Model P has the high moisture of extinction characteristic of the Southeast. The corresponding model for other long-needled pines is U.
Fuel Model Q	Upland Alaskan black spruce is represented by Fuel Model Q. The stands are dense but have frequent openings filled with usually inflammable shrub species. The forest floor is a deep layer of moss and lichens, but there is some needle litter and small-diameter branchwood. The branches are persistent on the trees, and ground fires easily reach into the tree crowns. This fuel model may be useful for jack pine stands in the Lake States. Ground fires are typically slow spreading, but a dangerous crowning potential exists. Users should be alert to such events and note those levels of SC and BI when crowning occurs.
Fuel Model R	This fuel model represents the hardwood areas after the canopies leaf out in the spring. It is provided as the off-season substitute for E. It should be used during the summer in all hardwood and mixed conifer-hardwood stands where more than half of the overstory is deciduous.
Fuel Model S	Alaskan or alpine tundra on relatively well-drained sites is the S fuel. Grass and low shrubs are often present, but the principal fuel is a deep layer of lichens and moss. Fires in these fuels are not fast spreading or intense, but are difficult to extinguish.
Fuel Model T	The bothersome sagebrush-grass types of the Great Basin and the Intermountain West are characteristic of T fuels. The shrubs burn easily and are not dense enough to shade out grass and other herbaceous plants. the shrubs must occupy at lease one-third of the site or the A or L fuel models should be used. Fuel Model T might be used for immature scrub oak and desert shrub associations in the West, and the scrub oak-wire grass type in the Southeast.
Fuel Model U	Closed stands of western long-needled pines are covered by this model. The ground fuels are primarily litter and small branchwood. Grass and shrubs are precluded by the dense canopy but occur in the occasional natural opening. Fuel Model U should be used for ponderosa, Jeffrey, sugar pine, and red pine stands of the Lake States. Fuel Model P is the corresponding model for southern pine plantations.

APPENDIX K: Climate Classes

PART 1: Descriptions of Climate Classes

The following table was excerpted from: "Gaining an Understanding of the National Fire Danger Rating System;" PMS-932/NFES-2665; National Wildland Fire Coordinating Group; May 2002; p. 57.

NFDRS Climate Class	Thornthwaite Humidity Province	Characteristic Vegetation	Regions
1	Arid	Desert (sparse grass and scattered shrubs)	Sonoran deserts of west Texas, New Mexico, southwest Arizona, southern Nevada, and western Utah; and the Mojave Desert of California.
1	Semiarid	Steppe (short grass and shrubs)	The short grass prairies of the Great Plains; the sagebrush steppes and pinyon/juniper woodlands of Wyoming, Montana, Idaho, Colorado, Utah, Arizona, Washington, and Oregon; and the grass steppes of the central valley of California.
2	Sub-humid (rainfall deficient in summer)	Savanna (grasslands, dense brush and open conifer forests)	The Alaskan interior; the chaparral of Colorado, Arizona, New Mexico, the Sierra Nevada foothills, and southern California; oak woodlands of California; ponderosa pine woodlands of the West; the mountain valleys (or parks) of the Northern and Central Rockies.
3	Sub-humid (rainfall adequate in all seasons)	Savanna (grasslands and open hardwood forests)	Blue stem prairies and blue stem-oak hickory savannas of Iowa, Missouri and Illinois.
3	Humid	Forests	Almost the entire eastern United States; and those higher elevations in the West that support dense forests.
4	Wet	Rain forests (redwoods, and spruce-cedar-hemlock)	Coast of northern California, Oregon, Washington, and southeast Alaska.

APPENDIX L: WFMI Access

PART 1: Rules and Guidelines for BLM Computer Systems

This appendix contains the general rules and guidelines for Bureau of Land Management (BLM) computer systems, including the Wildland Fire Management Information (WFMI) system and its fire reporting module.

Please read this document and retain a copy for your files prior to submitting a WFMI User Access Request Form. On the WFMI User Access Request Form, you must certify that you understand these requirements and will abide by them when using the WFMI fire reporting module.

This page was intentionally left blank.

GENERAL RULES AND GUIDELINES GOVERNING THE USE OF BUREAU OF LAND MANAGEMENT COMPUTER SYSTEMS

According to the Department of Interior Manual 375 DM 19.10B, "*It is the responsibility of each employee to report all suspected, actual or threatened incidents involving automated information systems to the authorities indicated below*."

$ **Bureau of Land Management (BLM) employees shall report observed computer security incidents or suspected computer security violations immediately to the Installation Information Technology (IT) Security Manager and to their supervisors.**

$ **The BLM Installation IT Security Manager may recommend the removal of any individual's User ID and password from any BLM computer system and/or application system in the event of a security incident.**

$ **Unauthorized access or misuse of BLM computer systems may subject violators to criminal, civil or administrative action. Criminal Penalties include fines and/or imprisonment of up to 20 years. Disciplinary action for administrative violations of the following rules may range from a verbal or written warning, removal of system access for a specific period of time, reassignment to other duties, or other action as deemed appropriate.**

Violations of the following rules are considered computer security incidents:

1. **CLASSIFIED INFORMATION.** No classified National Security information will be entered into any BLM computer system.

2. **GOVERNMENT PROPERTY.** Computer hardware, software, and data of the BLM are considered to be the property of the U.S. Government. BLM computer systems shall be used for official business only. No games, personal software, private data, unlicenced proprietary software, or otherwise non-government information will be used on or entered into any Government-owned computer system. Any use of computers, software or data for other than official business is expressly prohibited, except as permitted by the BLM Internet Acceptable Use Policy.

3. **PROPRIETARY PROPERTY.** Commercially developed and licensed software shall be treated as proprietary property of its developer. Title 17 of the U.S. Code states that "It is illegal to make or distribute copies of copyrighted material without authorization." The only exception is the user's right to make a backup for archival purposes, assuming one is not provided by the manufacturer. It is illegal to make copies of software for any other purpose without permission of the publisher. Unauthorized duplication of software is a Federal crime. Penalties include fines of up to $100,000 per infringement and jail terms of up to 5 years.

4. **ACCOUNTABILITY.** Individual User IDs and passwords shall be assigned only to persons having a valid requirement to access BLM computer systems. All activity accomplished under this User ID is directly attributable to the user to whom it is assigned.

GENERAL BUSINESS PRACTICES, which if not followed can lead to security incidents, are listed below. Noncompliance with these practices may result in removal of access and/or disciplinary or legal action being taken, consistent with the nature and scope of such activity.

1. **INDIVIDUAL USER IDs AND PASSWORDS.** Do not share your individual User IDs and passwords. They are to be used only by the individual owner. User IDs and passwords should not be written down except on the original assignment document. Once memorized, this document should be destroyed or, at a minimum, be kept in a locked safe or cabinet.

Under no circumstances should User IDs and passwords be posted ANYWHERE! Nor should they be kept in accessible locations. Never use personal information (e.g., telephone numbers, names of family members, pets, etc.) or dictionary words for your passwords. Passwords should be eight characters in length and consist of at least one numeric character, a special character, and both upper and lower case letters. Passwords should be changed at required intervals. If you believe your User ID and password have been compromised, change your password, notify your supervisor, and report the incident to the Installation IT Security Manager.

2. **UNAUTHORIZED ACCESS.** Access to BLM computer systems requires management approval. Do not attempt to gain access to any Information Technology system for which you do not have an approved and authorization to access.

3. **LOG OFF** when not actively working on the computer system. At a minimum, lock your workstation when leaving your work area for short periods of time or invoke the computer system's locking screen saver. **Remember, you are responsible for all activity logged under your User ID.**
